[87722] VGAM2599 gene encodes a VGAM2599 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2599 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2599 precursor RNA is designated SEQ ID:2585, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2585 is located at position 2974 relative to the genome of Obuda Pepper Virus.

[87723] VGAM2599 precursor RNA folds onto itself, forming VGAM2599 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87724] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2599 folded precursor RNA into VGAM2599 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2599 RNA is designated SEQ ID:5310, and is provided hereinbelow with reference to the sequence listing part.

[87725] VGAM2599 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2599 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2599 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87726] VGAM2599 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2599 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2599 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2599 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2599 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87727] The complementary binding of VGAM2599 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2599 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2599 host target RNA into VGAM2599 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87728] It is appreciated that VGAM2599 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2599 host target genes. The mRNA of each one of this plurality of VGAM2599 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2599 RNA, herein designated VGAM RNA, and which when bound by VGAM2599 RNA causes inhibition of translation of respective one or more VGAM2599 host target proteins.

[87729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2599 gene, herein designated VGAM GENE, on one or more VGAM2599 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87730] It is yet further appreciated that a function of VGAM2599 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of viral infection by Obuda Pepper Virus. Specific functions, and accordingly utilities, of VGAM2599 correlate with, and may be deduced from, the identity of the host target genes which VGAM2599 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[87731] Nucleotide sequences of the VGAM2599 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2599 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2599 are further described hereinbelow with reference to Table 1.

[87732] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2599 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2599 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87733] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2599 gene, herein designated VGAM is inhibition of expression of VGAM2599 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2599 correlate with, and may be deduced from, the identity of the target genes which VGAM2599 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87734] Restin (Reed-Steinberg cell-expressed intermediate filament-associated protein) (RSN, Accession NM_002956) is a VGAM2599 host target gene. RSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RSN BINDING SITE, designated SEQ ID:8865, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87735] A function of VGAM2599 is therefore inhibition of Restin (Reed-Steinberg cell-expressed intermediate filament-associated protein) (RSN, Accession NM_002956), a gene which seems to be a intermediate filament associated protein that links endocytic vesicles to microtubules. Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RSN. The function of RSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1086.BY55 (Accession XM_001667) is another VGAM2599 host target gene. BY55

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BY55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BY55 BINDING SITE, designated SEQ ID:29846, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87736] Another function of VGAM2599 is therefore inhibition of BY55 (Accession XM_001667). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BY55. FLJ13340 (Accession NM_057175) is another VGAM2599 host target gene. FLJ13340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13340 BINDING SITE, designated SEQ ID:27707, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87737] Another function of VGAM2599 is therefore inhibition of

FLJ13340 (Accession NM_057175). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13340. KIAA0092 (Accession NM_014679) is another VGAM2599 host target gene. KIAA0092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0092 BINDING SITE, designated SEQ ID:16154, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87738] Another function of VGAM2599 is therefore inhibition of KIAA0092 (Accession NM_014679). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0092. KIAA1361 (Accession XM_030845) is another VGAM2599 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31167, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87739] Another function of VGAM2599 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. Karyopherin (importin) Beta 3 (KPNB3, Accession NM_002271) is another VGAM2599 host target gene. KPNB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KPNB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNB3 BINDING SITE, designated SEQ ID:8062, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87740] Another function of VGAM2599 is therefore inhibition of Karyopherin (importin) Beta 3 (KPNB3, Accession NM_002271). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNB3. OSF-2 (Accession

NM_006475) is another VGAM2599 host target gene. OSF-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSF-2 BINDING SITE, designated SEQ ID:13198, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87741] Another function of VGAM2599 is therefore inhibition of OSF-2 (Accession NM_006475). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSF-2. TBDN100 (Accession NM_025085) is another VGAM2599 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24698, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5310.

[87742] Another function of VGAM2599 is therefore inhibition of TBDN100 (Accession NM_025085). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. Thioesterase, Adipose Associated (THEA, Accession XM_038922) is another VGAM2599 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32953, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87743] Another function of VGAM2599 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM_038922). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. LOC221431 (Accession XM_166380) is another VGAM2599 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44223, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87744] Another function of VGAM2599 is therefore inhibition of LOC221431 (Accession XM_166380). Accordingly, utilities of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC255326 (Accession XM_172832) is another VGAM2599 host target gene. LOC255326 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255326 BINDING SITE, designated SEQ ID:46107, to the nucleotide sequence of VGAM2599 RNA, herein designated VGAM RNA, also designated SEQ ID:5310.

[87745] Another function of VGAM2599 is therefore inhibition of LOC255326 (Accession XM_172832). Accordingly, utilities

of VGAM2599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255326. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2600 (VGAM2600) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87746] VGAM2600 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2600 was detected is described hereinabove with reference to Figs. 1-8.

[87747] VGAM2600 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Obuda Pepper Virus. VGAM2600 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87748] VGAM2600 gene encodes a VGAM2600 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2600 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2600 precursor RNA is designated SEQ ID:2586, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2586 is located at position 1275 relative to the genome of Obuda Pepper Virus.

[87749] VGAM2600 precursor RNA folds onto itself, forming VGAM2600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87750] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2600 folded precursor RNA into VGAM2600 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2600 RNA is designated SEQ ID:5311, and

is provided hereinbelow with reference to the sequence listing part.

[87751] VGAM2600 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2600 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2600 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87752] VGAM2600 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2600 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2600 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2600 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2600 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87753] The complementary binding of VGAM2600 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2600 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2600 host target RNA into VGAM2600 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87754] It is appreciated that VGAM2600 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2600 host target genes. The mRNA of each one of this plurality of VGAM2600 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2600 RNA, herein designated VGAM RNA, and which when bound by VGAM2600 RNA causes inhibition of translation of respective one or more VGAM2600 host target proteins.

[87755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2600 gene, herein designated VGAM GENE, on one or more VGAM2600 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87756] It is yet further appreciated that a function of VGAM2600 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of viral infection by Obuda Pepper Virus. Specific functions, and accordingly utilities, of VGAM2600 correlate with, and may be deduced from, the identity of the host target genes which VGAM2600 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87757] Nucleotide sequences of the VGAM2600 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2600 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2600 are further described hereinbelow with reference to Table 1.

[87758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2600 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2600 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87759] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2600 gene, herein designated VGAM is inhibition of expression of VGAM2600 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2600 correlate with, and may be deduced from, the identity of the target genes which VGAM2600 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87760] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is a VGAM2600 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40333, to the nucleotide sequence of VGAM2600 RNA, herein designated VGAM RNA, also designated SEQ ID:5311.

[87761] A function of VGAM2600 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5.

The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444.Interleukin 2 Receptor, Beta (IL2RB, Accession NM_000878) is another VGAM2600 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6569, to the nucleotide sequence of VGAM2600 RNA, herein designated VGAM RNA, also designated SEQ ID:5311.

[87762] Another function of VGAM2600 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450.FLJ14075

(Accession NM_024894) is another VGAM2600 host target gene. FLJ14075 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14075 BINDING SITE, designated SEQ ID:24372, to the nucleotide sequence of VGAM2600 RNA, herein designated VGAM RNA, also designated SEQ ID:5311.

[87763] Another function of VGAM2600 is therefore inhibition of FLJ14075 (Accession NM_024894). Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14075. MGC4707 (Accession NM_024113) is another VGAM2600 host target gene. MGC4707 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4707 BINDING SITE, designated SEQ ID:23562, to the nucleotide sequence of VGAM2600 RNA, herein designated VGAM

RNA, also designated SEQ ID:5311.

[87764] Another function of VGAM2600 is therefore inhibition of MGC4707 (Accession NM_024113). Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4707. Netrin 4 (NTN4, Accession XM_031896) is another VGAM2600 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31510, to the nucleotide sequence of VGAM2600 RNA, herein designated VGAM RNA, also designated SEQ ID:5311.

[87765] Another function of VGAM2600 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. LOC138429 (Accession XM_059973) is another VGAM2600 host target gene. LOC138429 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC138429, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138429 BINDING SITE, designated SEQ ID:37134, to the nucleotide sequence of VGAM2600 RNA, herein designated VGAM RNA, also designated SEQ ID:5311.

[87766] Another function of VGAM2600 is therefore inhibition of LOC138429 (Accession XM_059973). Accordingly, utilities of VGAM2600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138429. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2601 (VGAM2601) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87767] VGAM2601 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2601 was detected is described hereinabove with reference to Figs. 1-8.

[87768] VGAM2601 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Obuda Pepper Virus.

VGAM2601 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87769] VGAM2601 gene encodes a VGAM2601 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2601 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2601 precursor RNA is designated SEQ ID:2587, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2587 is located at position 589 relative to the genome of Obuda Pepper Virus.

[87770] VGAM2601 precursor RNA folds onto itself, forming VGAM2601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87771] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2601 folded precursor RNA into VGAM2601 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM2601 RNA is designated SEQ ID:5312, and is provided hereinbelow with reference to the sequence listing part.

[87772] VGAM2601 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2601 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2601 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87773] VGAM2601 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2601 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2601 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2601 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2601 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87774] The complementary binding of VGAM2601 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2601 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2601 host target RNA into VGAM2601 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87775] It is appreciated that VGAM2601 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2601 host target genes. The mRNA of each one of this plurality of VGAM2601 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2601 RNA, herein designated VGAM RNA, and which when bound by VGAM2601 RNA causes inhibition of translation of respective one or more VGAM2601 host target proteins.

[87776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2601 gene, herein designated VGAM GENE, on one or more VGAM2601 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87777] It is yet further appreciated that a function of VGAM2601 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2601 include diagnosis, prevention and treatment of viral infection by Obuda Pepper Virus. Specific functions, and accordingly utilities, of VGAM2601 correlate with, and may be deduced from, the identity of the host target genes which VGAM2601 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87778] Nucleotide sequences of the VGAM2601 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2601 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2601 are further described hereinbelow with reference to Table 1.

[87779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2601 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2601 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87780] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2601 gene, herein designated VGAM is inhibition of expression of VGAM2601 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2601 correlate with, and may be deduced from, the identity of the target genes which VGAM2601 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87781] DKFZp761N1114 (Accession XM_086327) is a VGAM2601 host target gene. DKFZp761N1114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:38602, to

the nucleotide sequence of VGAM2601 RNA, herein designated VGAM RNA, also designated SEQ ID:5312.

[87782] A function of VGAM2601 is therefore inhibition of DKFZp761N1114 (Accession XM_086327). Accordingly, utilities of VGAM2601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N1114. PRO2949 (Accession NM_018544) is another VGAM2601 host target gene. PRO2949 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2949, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2949 BINDING SITE, designated SEQ ID:20618, to the nucleotide sequence of VGAM2601 RNA, herein designated VGAM RNA, also designated SEQ ID:5312.

[87783] Another function of VGAM2601 is therefore inhibition of PRO2949 (Accession NM_018544). Accordingly, utilities of VGAM2601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2949. LOC147991 (Accession XM_085993) is another VGAM2601 host target gene. LOC147991 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC147991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:38433, to the nucleotide sequence of VGAM2601 RNA, herein designated VGAM RNA, also designated SEQ ID:5312.

[87784] Another function of VGAM2601 is therefore inhibition of LOC147991 (Accession XM_085993). Accordingly, utilities of VGAM2601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147991. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2602 (VGAM2602) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87785] VGAM2602 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2602 was detected is described hereinabove with reference to Figs. 1-8.

[87786] VGAM2602 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Obuda Pepper Virus. VGAM2602 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87787] VGAM2602 gene encodes a VGAM2602 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2602 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2602 precursor RNA is designated SEQ ID:2588, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2588 is located at position 2115 relative to the genome of Obuda Pepper Virus.

[87788] VGAM2602 precursor RNA folds onto itself, forming VGAM2602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87789] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2602 folded precursor RNA into VGAM2602 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2602 RNA is designated SEQ ID:5313, and is provided hereinbelow with reference to the sequence listing part.

[87790] VGAM2602 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2602 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2602 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87791] VGAM2602 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2602 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2602 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2602 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2602 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87792] The complementary binding of VGAM2602 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2602 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2602

host target RNA into VGAM2602 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87793] It is appreciated that VGAM2602 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2602 host target genes. The mRNA of each one of this plurality of VGAM2602 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2602 RNA, herein designated VGAM RNA, and which when bound by VGAM2602 RNA causes inhibition of translation of respective one or more VGAM2602 host target proteins.

[87794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2602 gene, herein designated VGAM GENE, on one or more VGAM2602 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87795] It is yet further appreciated that a function of VGAM2602 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2602 include diagnosis, prevention and treatment of viral infection by Obuda Pepper Virus. Specific functions, and accordingly utilities, of VGAM2602 correlate with, and may be deduced from, the identity of the host target genes which VGAM2602 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87796] Nucleotide sequences of the VGAM2602 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2602 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2602 are further

described hereinbelow with reference to Table 1.

[87797] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2602 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2602 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87798] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2602 gene, herein designated VGAM is inhibition of expression of VGAM2602 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2602 correlate with, and may be deduced from, the identity of the target genes which VGAM2602 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87799] Replication Factor C (activator 1) 1, 145kDa (RFC1, Accession NM_002913) is a VGAM2602 host target gene. RFC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

RFC1 BINDING SITE, designated SEQ ID:8819, to the nucleotide sequence of VGAM2602 RNA, herein designated VGAM RNA, also designated SEQ ID:5313.

[87800] A function of VGAM2602 is therefore inhibition of Replication Factor C (activator 1) 1, 145kDa (RFC1, Accession NM_002913), a gene which plays a role in dna transcription, replication and/or repair. Accordingly, utilities of VGAM2602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFC1. The function of RFC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.LOC90917 (Accession XM_034861) is another VGAM2602 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32172, to the nucleotide sequence of VGAM2602 RNA, herein designated VGAM RNA, also designated SEQ ID:5313.

[87801] Another function of VGAM2602 is therefore inhibition of

LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM2602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2603 (VGAM2603) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87802] VGAM2603 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2603 was detected is described hereinabove with reference to Figs. 1-8.

[87803] VGAM2603 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sugarcane Striate Mosaic Associated Virus. VGAM2603 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87804] VGAM2603 gene encodes a VGAM2603 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2603 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2603 precursor RNA is designated SEQ ID:2589, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2589 is located at position 5796 relative to the genome of Sugarcane Striate Mosaic Associated Virus.

[87805] VGAM2603 precursor RNA folds onto itself, forming VGAM2603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87806] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2603 folded precursor RNA into VGAM2603 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide se-

quence of VGAM2603 RNA is designated SEQ ID:5314, and is provided hereinbelow with reference to the sequence listing part.

[87807] VGAM2603 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2603 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2603 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87808] VGAM2603 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2603 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2603 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2603 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2603 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87809] The complementary binding of VGAM2603 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2603 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2603 host target RNA into VGAM2603 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87810] It is appreciated that VGAM2603 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2603 host target genes. The mRNA of each one of this plurality of VGAM2603 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2603 RNA, herein designated VGAM RNA, and which when bound by VGAM2603 RNA causes inhibition of translation of respective one or more VGAM2603 host target proteins.

[87811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2603 gene, herein designated VGAM GENE, on one or more VGAM2603 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87812] It is yet further appreciated that a function of VGAM2603

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of viral infection by Sugarcane Striate Mosaic Associated Virus. Specific functions, and accordingly utilities, of VGAM2603 correlate with, and may be deduced from, the identity of the host target genes which VGAM2603 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87813] Nucleotide sequences of the VGAM2603 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2603 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2603 are further described hereinbelow with reference to Table 1.

[87814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2603 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2603 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87815] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2603 gene, herein designated VGAM is inhibition of expression of VGAM2603 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2603 correlate with, and may be deduced from, the identity of the target genes which VGAM2603 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87816] Alcohol Dehydrogenase 5 (class III), Chi Polypeptide (ADH5, Accession NM_000671) is a VGAM2603 host target gene. ADH5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH5 BINDING SITE, designated SEQ ID:6325, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87817] A function of VGAM2603 is therefore inhibition of Alcohol Dehydrogenase 5 (class III), Chi Polypeptide (ADH5, Accession NM_000671), a gene which oxidizes ethanol and activated by fatty acids.It oxidizes ethanol very poorly. Accordingly, utilities of VGAM2603 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with ADH5. The function of ADH5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM438.Formyl Peptide Receptor-like 1 (FPRL1, Accession NM_001462) is another VGAM2603 host target gene. FPRL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FPRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FPRL1 BINDING SITE, designated SEQ ID:7197, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87818] Another function of VGAM2603 is therefore inhibition of Formyl Peptide Receptor-like 1 (FPRL1, Accession NM_001462). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPRL1. Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM_005729) is another VGAM2603 host target gene. PPIF BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PPIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIF BINDING SITE, designated SEQ ID:12285, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87819] Another function of VGAM2603 is therefore inhibition of Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM_005729), a gene which catalyzes the cis to trans isomerization of certain proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIF. The function of PPIF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251.Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_003479) is another VGAM2603 host target gene. PTP4A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTP4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE, designated SEQ ID:9556, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87820] Another function of VGAM2603 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_003479), a gene which is a protein tyrosine phosphatase which has a C-terminal prenylation site. Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A2. The function of PTP4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.KIAA0565 (Accession XM_039912) is another VGAM2603 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:33223, to the

nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87821] Another function of VGAM2603 is therefore inhibition of KIAA0565 (Accession XM_039912). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. NIMA (never in mitosis gene a)-related Kinase 1 (NEK1, Accession XM_171077) is another VGAM2603 host target gene. NEK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEK1 BINDING SITE, designated SEQ ID:45885, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87822] Another function of VGAM2603 is therefore inhibition of NIMA (never in mitosis gene a)-related Kinase 1 (NEK1, Accession XM_171077). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK1. RAB40C, Member RAS Oncogene Family (RAB40C, Acces-

sion NM_021168) is another VGAM2603 host target gene. RAB40C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB40C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40C BINDING SITE, designated SEQ ID:22148, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87823] Another function of VGAM2603 is therefore inhibition of RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM_021168). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40C. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM2603 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated

SEQ ID:25534, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87824] Another function of VGAM2603 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. Syntaxin 12 (STX12, Accession XM_039018) is another VGAM2603 host target gene. STX12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX12 BINDING SITE, designated SEQ ID:32985, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87825] Another function of VGAM2603 is therefore inhibition of Syntaxin 12 (STX12, Accession XM_039018). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX12. TRIP-Br2 (Accession NM_014755) is another

VGAM2603 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16481, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87826] Another function of VGAM2603 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC256207 (Accession XM_170837) is another VGAM2603 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45623, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87827] Another function of VGAM2603 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256207. LOC92597 (Accession XM_046066) is another VGAM2603 host target gene. LOC92597 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:34676, to the nucleotide sequence of VGAM2603 RNA, herein designated VGAM RNA, also designated SEQ ID:5314.

[87828] Another function of VGAM2603 is therefore inhibition of LOC92597 (Accession XM_046066). Accordingly, utilities of VGAM2603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2604 (VGAM2604) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[87829] VGAM2604 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2604 was detected is described hereinabove with reference to Figs. 1-8.

[87830] VGAM2604 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sugarcane Striate Mosaic Associated Virus. VGAM2604 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87831] VGAM2604 gene encodes a VGAM2604 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2604 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2604 precursor RNA is designated SEQ ID:2590, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2590 is located at position 3074 relative to the genome of Sugarcane Striate Mosaic Associated Virus.

[87832] VGAM2604 precursor RNA folds onto itself, forming VGAM2604 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87833] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2604 folded precursor RNA into VGAM2604 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2604 RNA is designated SEQ ID:5315, and is provided hereinbelow with reference to the sequence listing part.

[87834] VGAM2604 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2604 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2604 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87835] VGAM2604 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2604 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2604 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2604 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2604 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87836] The complementary binding of VGAM2604 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2604 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2604 host target RNA into VGAM2604 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87837] It is appreciated that VGAM2604 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2604 host target genes. The mRNA of each one of this plurality of VGAM2604 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2604 RNA, herein designated VGAM RNA, and which when bound by VGAM2604 RNA causes inhibition of translation of respective one or more VGAM2604 host target proteins.

[87838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2604 gene, herein designated VGAM GENE, on one or more VGAM2604 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87839] It is yet further appreciated that a function of VGAM2604 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of viral infection by Sugarcane Striate Mosaic Associated Virus. Specific functions, and accordingly utilities, of VGAM2604 correlate with, and may be deduced from, the identity of the host target genes which VGAM2604 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[87840] Nucleotide sequences of the VGAM2604 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2604 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2604 are further described hereinbelow with reference to Table 1.

[87841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2604 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2604 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87842] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2604 gene, herein designated VGAM is inhibition of expression of VGAM2604 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2604 correlate with, and may be deduced from, the identity of the target genes which VGAM2604 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87843] A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM_003488) is a VGAM2604 host target gene. AKAP1 BINDING SITE1 and AKAP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP1 BINDING SITE1 and AKAP1 BINDING SITE2, designated SEQ ID:9582 and SEQ ID:29268 respectively, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87844] A function of VGAM2604 is therefore inhibition of A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM_003488), a gene which binds to type i and ii regulatory subunits of protein kinase a . Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP1. The function of AKAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1392.Collagen, Type VI, Alpha 3 (COL6A3, Accession NM_057167) is another VGAM2604 host target gene.

COL6A3 BINDING SITE1 and COL6A3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL6A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL6A3 BINDING SITE1 and COL6A3 BINDING SITE2, designated SEQ ID:27670 and SEQ ID:10586 respectively, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87845] Another function of VGAM2604 is therefore inhibition of Collagen, Type VI, Alpha 3 (COL6A3, Accession NM_057167). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A3. Cytochrome P450, Subfamily VIIIB (sterol 12-alpha-hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391) is another VGAM2604 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE,

designated SEQ ID:10627, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87846] Another function of VGAM2604 is therefore inhibition of Cytochrome P450, Subfamily VIIIB (sterol 12-alpha-hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM2604 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20739, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ

ID:5315.

[87847] Another function of VGAM2604 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Espin (ESPN, Accession NM_031475) is another VGAM2604 host target gene. ESPN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPN BINDING SITE, designated SEQ ID:25550, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87848] Another function of VGAM2604 is therefore inhibition of Espin (ESPN, Accession NM_031475), a gene which a membrane-cytoskeletal assemblages . Accordingly, utili-

ties of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPN. The function of ESPN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006.Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134) is another VGAM2604 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5627, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87849] Another function of VGAM2604 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951.Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190) is another VGAM2604 host target gene. FANCC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FANCC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCC BINDING SITE, designated SEQ ID:34908, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87850] Another function of VGAM2604 is therefore inhibition of Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCC. Fer (fps/fes related) Tyrosine Kinase (phosphoprotein NCP94) (FER, Accession NM_005246) is another VGAM2604 host target gene. FER BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FER, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER BINDING SITE, designated SEQ ID:11756, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87851] Another function of VGAM2604 is therefore inhibition of Fer (fps/fes related) Tyrosine Kinase (phosphoprotein NCP94) (FER, Accession NM_005246), a gene which Non-receptor protein tyrosine kinase; member of the Src family. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER. The function of FER and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM224.Forkhead Box E3 (FOXE3, Accession NM_012186) is another VGAM2604 host target gene. FOXE3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXE3 BINDING SITE, designated SEQ ID:14473, to the nucleotide sequence of

VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87852] Another function of VGAM2604 is therefore inhibition of Forkhead Box E3 (FOXE3, Accession NM_012186), a gene which regulates embryonic development. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE3. The function of FOXE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM632.Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221) is another VGAM2604 host target gene. ITPKB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:7983, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87853] Another function of VGAM2604 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession

NM_002221), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB. The function of ITPKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1252.LFG (Accession XM_084780) is another VGAM2604 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37699, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87854] Another function of VGAM2604 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. MHC Class II Transactivator (MHC2TA, Accession NM_000246) is another VGAM2604 host target gene.

MHC2TA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5785, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87855] Another function of VGAM2604 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM_000246). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Nebulin-related Anchoring Protein (Nrap, Accession NM_139235) is another VGAM2604 host target gene. Nrap BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Nrap, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nrap BINDING SITE, designated SEQ ID:29238, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA,

also designated SEQ ID:5315.

[87856] Another function of VGAM2604 is therefore inhibition of Nebulin-related Anchoring Protein (Nrap, Accession NM_139235), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to protein complexes located beneath the sarcolemma. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nrap. The function of Nrap and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM649.Parathyroid Hormone Receptor 2 (PTHR2, Accession NM_005048) is another VGAM2604 host target gene. PTHR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTHR2 BINDING SITE, designated SEQ ID:11482, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87857] Another function of VGAM2604 is therefore inhibition of

Parathyroid Hormone Receptor 2 (PTHR2, Accession NM_005048), a gene which is a G protein-coupled receptor selective for parathyroid hormone binding. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTHR2. The function of PTHR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM607.Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030668) is another VGAM2604 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE3, designated SEQ ID:25015, SEQ ID:25024 and SEQ ID:25035 respectively, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87858] Another function of VGAM2604 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO,

Accession NM_030668), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140.Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM2604 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10369, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87859] Another function of VGAM2604 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine pro-

tease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.Src-like-adaptor 2 (SLA2, Accession NM_032214) is another VGAM2604 host target gene. SLA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLA2 BINDING SITE, designated SEQ ID:25944, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87860] Another function of VGAM2604 is therefore inhibition of Src-like-adaptor 2 (SLA2, Accession NM_032214). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA2. Solute Carrier Family 22 (organic cation transporter), Member 2 (SLC22A2, Accession

XM_004235) is another VGAM2604 host target gene. SLC22A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC22A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A2 BINDING SITE, designated SEQ ID:29942, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87861] Another function of VGAM2604 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter), Member 2 (SLC22A2, Accession XM_004235), a gene which is an organic cation transporter that may mediate first step in cation resorption. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A2. The function of SLC22A2 has been established by previous studies. Polyspecific organic cation transporters in the liver, kidney, and intestine are critical for elimination of many endogenous amines as well as a wide array of drugs and environmental toxins. Using PCR with primers derived from rat OCT1 (OMIM Ref. No. 602607),

Gorboulev et al. (1997) cloned the human organic cation transporters OCT1 and OCT2 from human kidney cortex cDNA. The predicted 555-amino acid OCT2 protein has 12 putative transmembrane domains and is 70% identical to human OCT1 protein. On Northern blots, OCT2 was expressed as 2.5- and 4.0-kb mRNAs mainly in kidney, although RT-PCR detected OCT2 expression in a few other tissues. Using in situ hybridization and immunohistochemistry, Gorboulev et al. (1997) found that OCT2 is localized at the luminal membrane of the kidney distal tubule. Xenopus oocytes expressing OCT2 showed increased cation uptake. A bidirectional silencer for a 400-kb region that contains 3 imprinted, maternally expressed protein-coding genes (IGF2R, 147280; SLC22A2; SLC22A3) has been shown by targeted deletion to be located in a sequence of 3.7 kb, which also contains the promoter for the imprinted, paternally expressed noncoding Air RNA. Expression of Air is correlated with repression of all 3 genes on the paternal allele; however, Air RNA overlaps just 1 of these genes in an antisense orientation. By inserting a polyadenylation signal that truncates 96% of the RNA transcript, Sleutels et al. (2002) demonstrated that Air RNA is required for silencing. The trun-

cated Air allele maintains imprinted expression and methylation of the Air promoter, but shows complete loss of silencing of the IGF2R/SLC22A2/SLC22A3 gene cluster on the paternal chromosome. Sleutels et al. (2002) concluded that noncoding RNAs have an active role in genomic imprinting

[87862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[87863] Gorboulev, V.; Ulzheimer, J. C.; Akhoundova, A.; Ulzheimer-Teuber, I.; Karbach, U.; Quester, S.; Baumann, C.; Lang, F.; Busch, A. E.; Koepsell, H. : Cloning and characterization of two human polyspecific organic cation transporters. DNA Cell Biol. 16: 871-881, 1997. ; and

[87864] Sleutels, F.; Zwart, R.; Barlow, D. P. : The non-coding Air RNA is required for silencing autosomal imprinted genes. Nature 415: 810-813, 2002.

[87865] Further studies establishing the function and utilities of SLC22A2 are found in John Hopkins OMIM database record ID 602608, and in sited publications numbered 1114, 1116, 111 and 5233 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Solute Carrier Family 7 (cationic amino acid

transporter, y+ system), Member 8 (SLC7A8, Accession NM_012244) is another VGAM2604 host target gene. SLC7A8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC7A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A8 BINDING SITE, designated SEQ ID:14553, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87866] Another function of VGAM2604 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 8 (SLC7A8, Accession NM_012244), a gene which helps mediate transport of large and small neutral amino acids. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A8. The function of SLC7A8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1263.SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 2

(SMARCA2, Accession NM_003070) is another VGAM2604 host target gene. SMARCA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMARCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCA2 BINDING SITE, designated SEQ ID:9035, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87867] Another function of VGAM2604 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 2 (SMARCA2, Accession NM_003070), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCA2. The function of SMARCA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_018727) is another VGAM2604 host target

gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:20816, SEQ ID:27996, SEQ ID:28004 and SEQ ID:28013 respectively, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87868] Another function of VGAM2604 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_018727), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM_030775) is another VGAM2604 host target gene. WNT5B BINDING

SITE1 and WNT5B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT5B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5B BINDING SITE1 and WNT5B BINDING SITE2, designated SEQ ID:25060 and SEQ ID:26362 respectively, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87869] Another function of VGAM2604 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM_030775), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule . Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5B. The function of WNT5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928.Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769) is another VGAM2604

host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44790, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87870] Another function of VGAM2604 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. C2F (Accession NM_006331) is another VGAM2604 host target gene. C2F BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C2F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C2F BINDING SITE, designated SEQ ID:13030, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87871] Another function of VGAM2604 is therefore inhibition of C2F (Accession NM_006331). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C2F. Cab45 (Accession NM_016176) is another VGAM2604 host target gene. Cab45 BINDING SITE1 and Cab45 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Cab45, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Cab45 BINDING SITE1 and Cab45 BINDING SITE2, designated SEQ ID:18278 and SEQ ID:18621 respectively, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87872] Another function of VGAM2604 is therefore inhibition of Cab45 (Accession NM_016176). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Cab45. DKFZP434B205 (Accession XM_059966) is another VGAM2604 host target gene. DKFZP434B205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B205,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B205 BINDING SITE, designated SEQ ID:37128, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87873] Another function of VGAM2604 is therefore inhibition of DKFZP434B205 (Accession XM_059966). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B205. DKFZP434C128 (Accession XM_036086) is another VGAM2604 host target gene. DKFZP434C128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C128 BINDING SITE, designated SEQ ID:32375, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87874] Another function of VGAM2604 is therefore inhibition of

DKFZP434C128 (Accession XM_036086). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C128. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM2604 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33036, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87875] Another function of VGAM2604 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. EDR2 (Accession XM_018136) is another VGAM2604 host target gene. EDR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EDR2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR2 BINDING SITE, designated SEQ ID:30338, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87876] Another function of VGAM2604 is therefore inhibition of EDR2 (Accession XM_018136). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR2. FLJ10743 (Accession NM_018201) is another VGAM2604 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20082, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87877] Another function of VGAM2604 is therefore inhibition of FLJ10743 (Accession NM_018201). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10743. FLJ13197 (Accession NM_024614) is another VGAM2604 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:23873, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87878] Another function of VGAM2604 is therefore inhibition of FLJ13197 (Accession NM_024614). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. FLJ22659 (Accession NM_024934) is another VGAM2604 host target gene. FLJ22659 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22659 BINDING SITE, designated SEQ ID:24471, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM

RNA, also designated SEQ ID:5315.

[87879] Another function of VGAM2604 is therefore inhibition of FLJ22659 (Accession NM_024934). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22659. FLJ22814 (Accession NM_024916) is another VGAM2604 host target gene. FLJ22814 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:24444, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87880] Another function of VGAM2604 is therefore inhibition of FLJ22814 (Accession NM_024916). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814. HERV-H LTR-associating 2 (HHLA2, Accession NM_007072) is another VGAM2604 host target gene. HHLA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

HHLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:13939, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87881] Another function of VGAM2604 is therefore inhibition of HERV-H LTR-associating 2 (HHLA2, Accession NM_007072). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA2. HSNOV1 (Accession NM_017515) is another VGAM2604 host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1 BINDING SITE, designated SEQ ID:18968, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87882] Another function of VGAM2604 is therefore inhibition of

HSNOV1 (Accession NM_017515). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSNOV1. KIAA0252 (Accession XM_031646) is another VGAM2604 host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:31452, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87883] Another function of VGAM2604 is therefore inhibition of KIAA0252 (Accession XM_031646). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. KIAA0416 (Accession NM_015564) is another VGAM2604 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17835, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87884] Another function of VGAM2604 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0420 (Accession XM_032693) is another VGAM2604 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31731, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87885] Another function of VGAM2604 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0435 (Accession NM_014801) is another

VGAM2604 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16725, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87886] Another function of VGAM2604 is therefore inhibition of KIAA0435 (Accession NM_014801). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0435. KIAA0841 (Accession XM_049237) is another VGAM2604 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35364, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87887] Another function of VGAM2604 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA0847 (Accession XM_085298) is another VGAM2604 host target gene. KIAA0847 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0847 BINDING SITE, designated SEQ ID:38048, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87888] Another function of VGAM2604 is therefore inhibition of KIAA0847 (Accession XM_085298). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0847. KIAA1069 (Accession XM_042635) is another VGAM2604 host target gene. KIAA1069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1069, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:33725, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87889] Another function of VGAM2604 is therefore inhibition of KIAA1069 (Accession XM_042635). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069. KIAA1157 (Accession XM_051093) is another VGAM2604 host target gene. KIAA1157 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:35755, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87890] Another function of VGAM2604 is therefore inhibition of KIAA1157 (Accession XM_051093). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1157. KIAA1755 (Accession XM_028810) is another VGAM2604 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30754, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87891] Another function of VGAM2604 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. MEF-2 (Accession XM_034883) is another VGAM2604 host target gene. MEF-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF-2 BINDING SITE, designated SEQ ID:32181, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5315.

[87892] Another function of VGAM2604 is therefore inhibition of MEF-2 (Accession XM_034883). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF-2. MGC13053 (Accession NM_032710) is another VGAM2604 host target gene. MGC13053 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13053 BINDING SITE, designated SEQ ID:26425, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87893] Another function of VGAM2604 is therefore inhibition of MGC13053 (Accession NM_032710). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13053. MGC9912 (Accession NM_080664) is another VGAM2604 host target gene. MGC9912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC9912, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9912 BINDING SITE, designated SEQ ID:27953, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87894] Another function of VGAM2604 is therefore inhibition of MGC9912 (Accession NM_080664). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9912. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714) is another VGAM2604 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:28956, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87895] Another function of VGAM2604 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive

(NFAT5, Accession NM_138714). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. Phosphodiesterase 2A, CGMP-stimulated (PDE2A, Accession NM_002599) is another VGAM2604 host target gene. PDE2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE2A BINDING SITE, designated SEQ ID:8461, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87896] Another function of VGAM2604 is therefore inhibition of Phosphodiesterase 2A, CGMP-stimulated (PDE2A, Accession NM_002599). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE2A. Retinoic Acid Induced 17 (RAI17, Accession XM_166091) is another VGAM2604 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43865, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87897] Another function of VGAM2604 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM_166091). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. RBT1 (Accession NM_013368) is another VGAM2604 host target gene. RBT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBT1 BINDING SITE, designated SEQ ID:15014, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87898] Another function of VGAM2604 is therefore inhibition of RBT1 (Accession NM_013368). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBT1.

Small EDRK-rich Factor 2 (SERF2, Accession NM_005770) is another VGAM2604 host target gene. SERF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SERF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERF2 BINDING SITE, designated SEQ ID:12341, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87899] Another function of VGAM2604 is therefore inhibition of Small EDRK-rich Factor 2 (SERF2, Accession NM_005770). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF2. SS-56 (Accession XM_006063) is another VGAM2604 host target gene. SS-56 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:29986, to the nucleotide sequence of VGAM2604 RNA,

herein designated VGAM RNA, also designated SEQ ID:5315.

[87900] Another function of VGAM2604 is therefore inhibition of SS-56 (Accession XM_006063). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56. Tetratricopeptide Repeat Domain 4 (TTC4, Accession XM_038926) is another VGAM2604 host target gene. TTC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC4 BINDING SITE, designated SEQ ID:32959, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87901] Another function of VGAM2604 is therefore inhibition of Tetratricopeptide Repeat Domain 4 (TTC4, Accession XM_038926). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC4. LOC113763 (Accession NM_138434) is another VGAM2604 host target gene. LOC113763 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by LOC113763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:28805, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87902] Another function of VGAM2604 is therefore inhibition of LOC113763 (Accession NM_138434). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113763. LOC124221 (Accession XM_058785) is another VGAM2604 host target gene. LOC124221 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC124221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124221 BINDING SITE, designated SEQ ID:36743, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87903] Another function of VGAM2604 is therefore inhibition of

LOC124221 (Accession XM_058785). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124221. LOC138199 (Accession XM_059950) is another VGAM2604 host target gene. LOC138199 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC138199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138199 BINDING SITE, designated SEQ ID:37118, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87904] Another function of VGAM2604 is therefore inhibition of LOC138199 (Accession XM_059950). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138199. LOC150113 (Accession XM_104532) is another VGAM2604 host target gene. LOC150113 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC150113 BINDING SITE, designated SEQ ID:42169, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87905] Another function of VGAM2604 is therefore inhibition of LOC150113 (Accession XM_104532). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150113. LOC152315 (Accession XM_087440) is another VGAM2604 host target gene. LOC152315 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152315 BINDING SITE, designated SEQ ID:39257, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87906] Another function of VGAM2604 is therefore inhibition of LOC152315 (Accession XM_087440). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152315. LOC152328 (Accession XM_087420) is an-

other VGAM2604 host target gene. LOC152328 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152328 BINDING SITE, designated SEQ ID:39243, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87907] Another function of VGAM2604 is therefore inhibition of LOC152328 (Accession XM_087420). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152328. LOC158527 (Accession XM_088594) is another VGAM2604 host target gene. LOC158527 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158527 BINDING SITE, designated SEQ ID:39860, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87908] Another function of VGAM2604 is therefore inhibition of LOC158527 (Accession XM_088594). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158527. LOC196500 (Accession XM_113734) is another VGAM2604 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196500 BINDING SITE, designated SEQ ID:42387, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87909] Another function of VGAM2604 is therefore inhibition of LOC196500 (Accession XM_113734). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC196759 (Accession XM_113601) is another VGAM2604 host target gene. LOC196759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196759, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196759 BINDING SITE, designated SEQ ID:42295, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87910] Another function of VGAM2604 is therefore inhibition of LOC196759 (Accession XM_113601). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196759. LOC200205 (Accession XM_114152) is another VGAM2604 host target gene. LOC200205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200205 BINDING SITE, designated SEQ ID:42738, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87911] Another function of VGAM2604 is therefore inhibition of LOC200205 (Accession XM_114152). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200205. LOC221463 (Accession XM_166374) is another VGAM2604 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44205, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87912] Another function of VGAM2604 is therefore inhibition of LOC221463 (Accession XM_166374). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC221922 (Accession XM_166555) is another VGAM2604 host target gene. LOC221922 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:44536, to the nucleotide sequence of VGAM2604 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5315.

[87913] Another function of VGAM2604 is therefore inhibition of LOC221922 (Accession XM_166555). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922. LOC254082 (Accession XM_173165) is another VGAM2604 host target gene. LOC254082 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254082 BINDING SITE, designated SEQ ID:46423, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87914] Another function of VGAM2604 is therefore inhibition of LOC254082 (Accession XM_173165). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254082. LOC257354 (Accession XM_170810) is another VGAM2604 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257354, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45584, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87915] Another function of VGAM2604 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC257612 (Accession XM_175270) is another VGAM2604 host target gene. LOC257612 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257612 BINDING SITE, designated SEQ ID:46741, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87916] Another function of VGAM2604 is therefore inhibition of LOC257612 (Accession XM_175270). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257612. LOC51696 (Accession NM_016217) is another VGAM2604 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18314, to the nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87917] Another function of VGAM2604 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. LOC91694 (Accession XM_040082) is another VGAM2604 host target gene. LOC91694 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91694 BINDING SITE, designated SEQ ID:33250, to the

nucleotide sequence of VGAM2604 RNA, herein designated VGAM RNA, also designated SEQ ID:5315.

[87918] Another function of VGAM2604 is therefore inhibition of LOC91694 (Accession XM_040082). Accordingly, utilities of VGAM2604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91694. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2605 (VGAM2605) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87919] VGAM2605 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2605 was detected is described hereinabove with reference to Figs. 1-8.

[87920] VGAM2605 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Salmon Pancreas Disease Virus. VGAM2605 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87921] VGAM2605 gene encodes a VGAM2605 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2605 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2605 precursor RNA is designated SEQ ID:2591, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2591 is located at position 9457 relative to the genome of Salmon Pancreas Disease Virus.

[87922] VGAM2605 precursor RNA folds onto itself, forming VGAM2605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87923] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2605 folded precursor RNA into VGAM2605 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2605 RNA is designated SEQ ID:5316, and is provided hereinbelow with reference to the sequence listing part.

[87924] VGAM2605 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2605 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2605 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87925] VGAM2605 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2605 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2605 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2605 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2605 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87926] The complementary binding of VGAM2605 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2605 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2605 host target RNA into VGAM2605 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87927] It is appreciated that VGAM2605 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2605 host target genes. The mRNA of each one of this plurality of VGAM2605 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2605 RNA, herein designated VGAM RNA, and which when bound by VGAM2605 RNA causes inhibition of translation of respective one or more VGAM2605 host target proteins.

[87928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2605 gene, herein designated VGAM GENE, on one or more VGAM2605 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87929] It is yet further appreciated that a function of VGAM2605 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2605 include diagnosis, prevention and treatment of viral infection by Salmon Pancreas Disease Virus. Specific functions, and accordingly utilities, of VGAM2605 correlate with, and may be deduced from, the identity of the host target genes which VGAM2605 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87930] Nucleotide sequences of the VGAM2605 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2605 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2605 are further described hereinbelow with reference to Table 1.

[87931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2605 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2605 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87932] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2605 gene, herein designated VGAM is inhibition of expression of VGAM2605 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2605 correlate with, and may be deduced from, the identity of the target genes which VGAM2605 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87933] FLJ11850 (Accession NM_022741) is a VGAM2605 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22951, to the nucleotide sequence of VGAM2605 RNA, herein designated VGAM RNA, also designated SEQ ID:5316.

[87934] A function of VGAM2605 is therefore inhibition of FLJ11850 (Accession NM_022741). Accordingly, utilities of

VGAM2605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850. RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM_171061) is another VGAM2605 host target gene. RAP2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP2B BINDING SITE, designated SEQ ID:45860, to the nucleotide sequence of VGAM2605 RNA, herein designated VGAM RNA, also designated SEQ ID:5316.

[87935] Another function of VGAM2605 is therefore inhibition of RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM_171061). Accordingly, utilities of VGAM2605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP2B. LOC121274 (Accession XM_058547) is another VGAM2605 host target gene. LOC121274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121274 BINDING SITE, designated SEQ ID:36657, to the nucleotide sequence of VGAM2605 RNA, herein designated VGAM RNA, also designated SEQ ID:5316.

[87936] Another function of VGAM2605 is therefore inhibition of LOC121274 (Accession XM_058547). Accordingly, utilities of VGAM2605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121274. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2606 (VGAM2606) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87937] VGAM2606 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2606 was detected is described hereinabove with reference to Figs. 1-8.

[87938] VGAM2606 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Salmon Pancreas Disease Virus. VGAM2606 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87939] VGAM2606 gene encodes a VGAM2606 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2606 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2606 precursor RNA is designated SEQ ID:2592, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2592 is located at position 11312 relative to the genome of Salmon Pancreas Disease Virus.

[87940] VGAM2606 precursor RNA folds onto itself, forming VGAM2606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2606 folded precursor RNA into VGAM2606

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2606 RNA is designated SEQ ID:5317, and is provided hereinbelow with reference to the sequence listing part.

[87942] VGAM2606 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2606 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2606 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87943] VGAM2606 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2606 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2606 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2606 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2606 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87944] The complementary binding of VGAM2606 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2606 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2606 host target RNA into VGAM2606 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[87945] It is appreciated that VGAM2606 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2606 host target genes. The mRNA of each one of this plurality of VGAM2606 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2606 RNA, herein designated VGAM RNA, and which when bound by VGAM2606 RNA causes inhibition of translation of respective one or more VGAM2606 host target proteins.

[87946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2606 gene, herein designated VGAM GENE, on one or more VGAM2606 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87947] It is yet further appreciated that a function of VGAM2606 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2606 include diagnosis, prevention and treatment of viral infection by Salmon Pancreas Disease Virus. Specific functions, and accordingly utilities, of VGAM2606 correlate with, and may be deduced from, the identity of the host target genes which VGAM2606 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87948] Nucleotide sequences of the VGAM2606 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2606 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2606 are further described hereinbelow with reference to Table 1.

[87949] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2606 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2606 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2606 gene, herein designated VGAM is inhibition of expression of VGAM2606 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2606 correlate with, and may be deduced from, the identity of the target genes which VGAM2606 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87951] Grancalcin, EF-hand Calcium Binding Protein (GCA, Accession NM_012198) is a VGAM2606 host target gene. GCA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCA BINDING SITE, designated SEQ ID:14497, to the nucleotide sequence of VGAM2606 RNA, herein designated

VGAM RNA, also designated SEQ ID:5317.

[87952] A function of VGAM2606 is therefore inhibition of Grancalcin, EF-hand Calcium Binding Protein (GCA, Accession NM_012198), a gene which may play a role in granule-membrane fusion and degranulation. Accordingly, utilities of VGAM2606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCA. The function of GCA has been established by previous studies. By probing with antibody to the purified protein, Boyhan et al. (1992) cloned GCA, which they called grancalcin, from a promyocytic cell line expression library. The deduced 217-amino acid protein has a calculated molecular mass of 24 kD. The sequence contains an EF-hand calcium-binding region, a potential phosphorylation site, and 2 potential N-glycosylation sites. GCA shares 58% identity over 192 amino acids with sorcin (OMIM Ref. No. 182520), and about 30% identity over the calcium-binding domains of calpains (see OMIM Ref. No. 114220). Northern blot analysis revealed abundant expression of a 1.65-kb transcript in bone marrow and weaker expression in neutrophils, myeloid leukemic cells, and 2 Epstein-Barr virus-transformed B-cell lines. By Western blot analysis, a 28-kD protein was observed in B

and T cells at low concentrations, and at higher levels in neutrophils and macrophages. Subcellular fractionation showed localization to be dependent upon Ca(2+) and Mg(2+). In the absence of divalent cation, grancalcin localized to the cytosolic fraction; with Mg(2+) alone, it partitioned with the granule fraction; and in the presence of Mg(2+) and Ca(2+), it associated with both the granule and membrane fractions. Teahan et al. (1992) purified grancalcin from leukopheresis samples of patients with chronic granulocytic leukemia. The purified protein migrated as a 28-kD protein by SDS-PAGE and formed homodimers of 55 kD upon gel filtration that was independent of reducing agents. No biochemical evidence was found for phosphorylation or glycosylation. Calcium binding was suggested by the difference in migration on SDS/PAGE between calcium-loaded and calcium-depleted preparations, and was confirmed by the binding of Ca(2+) to slot blots of the native protein.

[87953] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[87954] Boyhan, A.; Casimir, C. M.; French, J. K.; Teahan, C. G.; Segal, A. W. : Molecular cloning and characterization of

grancalcin, a novel EF-hand calcium-binding protein abundant in neutrophils and monocytes. J. Biol. Chem. 267: 2928-2933, 1992. ; and

[87955] Teahan, C. G.; Totty, N. F.; Segal, A. W. : Isolation and characterization of grancalcin, a novel 28 kDa EF-hand calcium-binding protein from human neutrophils. Biochem. J. 286: 549-554.

[87956] Further studies establishing the function and utilities of GCA are found in John Hopkins OMIM database record ID 607030, and in sited publications numbered 5384-5385 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM_002397) is another VGAM2606 host target gene. MEF2C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEF2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:8215, to the nucleotide sequence of VGAM2606 RNA, herein designated VGAM RNA, also designated SEQ ID:5317.

[87957] Another function of VGAM2606 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM_002397), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM2606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C. The function of MEF2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386.Cab45 (Accession NM_016176) is another VGAM2606 host target gene. Cab45 BINDING SITE1 and Cab45 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Cab45, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Cab45 BINDING SITE1 and Cab45 BINDING SITE2, designated SEQ ID:18279 and SEQ ID:18622 respectively, to the nucleotide sequence of VGAM2606 RNA, herein designated VGAM RNA, also designated SEQ ID:5317.

[87958] Another function of VGAM2606 is therefore inhibition of

Cab45 (Accession NM_016176). Accordingly, utilities of VGAM2606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Cab45. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM2606 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18739, to the nucleotide sequence of VGAM2606 RNA, herein designated VGAM RNA, also designated SEQ ID:5317.

[87959] Another function of VGAM2606 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM2606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2607 (VGAM2607) viral gene, which modulates expression of

respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87960] VGAM2607 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2607 was detected is described hereinabove with reference to Figs. 1-8.

[87961] VGAM2607 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ljungan Virus. VGAM2607 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87962] VGAM2607 gene encodes a VGAM2607 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2607 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2607 precursor RNA is designated SEQ ID:2593, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2593 is located at position 7425 relative to the genome of Ljungan Virus.

[87963] VGAM2607 precursor RNA folds onto itself, forming VGAM2607 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87964] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2607 folded precursor RNA into VGAM2607 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2607 RNA is designated SEQ ID:5318, and is provided hereinbelow with reference to the sequence listing part.

[87965] VGAM2607 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2607 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2607 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87966] VGAM2607 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2607 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2607 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2607 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2607 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87967] The complementary binding of VGAM2607 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2607 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2607 host target RNA into VGAM2607 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87968] It is appreciated that VGAM2607 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2607 host target genes. The mRNA of each one of this plurality of VGAM2607 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2607 RNA, herein designated VGAM RNA, and which when bound by VGAM2607 RNA causes inhibition of translation of respective one or more VGAM2607 host target proteins.

[87969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2607 gene, herein designated VGAM GENE, on one or more VGAM2607 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87970] It is yet further appreciated that a function of VGAM2607 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of viral infection by Ljungan Virus. Specific functions, and accordingly utilities, of VGAM2607 correlate with, and may be deduced from, the identity of the host target genes which VGAM2607 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[87971] Nucleotide sequences of the VGAM2607 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2607 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2607 are further described hereinbelow with reference to Table 1.

[87972] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2607 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2607 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87973] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2607 gene, herein designated VGAM is inhibition of expression of VGAM2607 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2607 correlate with, and may be deduced from, the identity of the target genes which VGAM2607 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87974] BTB (POZ) Domain Containing 1 (BTBD1, Accession NM_025238) is a VGAM2607 host target gene. BTBD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTBD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD1 BINDING SITE, designated SEQ ID:24921, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87975] A function of VGAM2607 is therefore inhibition of BTB (POZ) Domain Containing 1 (BTBD1, Accession NM_025238). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD1. DKFZP586N0721 (Accession NM_015400) is another VGAM2607 host target gene. DKFZP586N0721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586N0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586N0721 BINDING SITE, designated SEQ ID:17711, to the nucleotide

sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87976] Another function of VGAM2607 is therefore inhibition of DKFZP586N0721 (Accession NM_015400). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586N0721. MGC2752 (Accession XM_085842) is another VGAM2607 host target gene. MGC2752 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2752 BINDING SITE, designated SEQ ID:38367, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87977] Another function of VGAM2607 is therefore inhibition of MGC2752 (Accession XM_085842). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2752. LOC146953 (Accession XM_085659) is another VGAM2607 host target gene. LOC146953 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC146953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146953 BINDING SITE, designated SEQ ID:38285, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87978] Another function of VGAM2607 is therefore inhibition of LOC146953 (Accession XM_085659). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146953. LOC151647 (Accession XM_087261) is another VGAM2607 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151647 BINDING SITE, designated SEQ ID:39154, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87979] Another function of VGAM2607 is therefore inhibition of LOC151647 (Accession XM_087261). Accordingly, utilities

of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. LOC152453 (Accession XM_087475) is another VGAM2607 host target gene. LOC152453 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152453 BINDING SITE, designated SEQ ID:39275, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87980] Another function of VGAM2607 is therefore inhibition of LOC152453 (Accession XM_087475). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152453. LOC254431 (Accession XM_173024) is another VGAM2607 host target gene. LOC254431 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254431 BINDING SITE, designated SEQ ID:46291, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87981] Another function of VGAM2607 is therefore inhibition of LOC254431 (Accession XM_173024). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254431. LOC254778 (Accession XM_171193) is another VGAM2607 host target gene. LOC254778 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:45978, to the nucleotide sequence of VGAM2607 RNA, herein designated VGAM RNA, also designated SEQ ID:5318.

[87982] Another function of VGAM2607 is therefore inhibition of LOC254778 (Accession XM_171193). Accordingly, utilities of VGAM2607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2608 (VGAM2608) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87983] VGAM2608 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2608 was detected is described hereinabove with reference to Figs. 1-8.

[87984] VGAM2608 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ljungan Virus. VGAM2608 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87985] VGAM2608 gene encodes a VGAM2608 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2608 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2608 precursor RNA is designated SEQ ID:2594, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2594 is located at position 6824 relative to the

genome of Ljungan Virus.

[87986] VGAM2608 precursor RNA folds onto itself, forming VGAM2608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87987] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2608 folded precursor RNA into VGAM2608 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM2608 RNA is designated SEQ ID:5319, and is provided hereinbelow with reference to the sequence listing part.

[87988] VGAM2608 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2608 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2608 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87989] VGAM2608 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2608 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2608 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2608 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2608 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87990] The complementary binding of VGAM2608 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2608 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2608 host target RNA into VGAM2608 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87991] It is appreciated that VGAM2608 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2608 host target genes. The mRNA of each one of this plurality of VGAM2608 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2608 RNA, herein designated VGAM RNA, and which when bound by VGAM2608 RNA causes inhibition of translation of respective one or more VGAM2608 host target proteins.

[87992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2608 gene, herein designated VGAM GENE, on one or more VGAM2608 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87993] It is yet further appreciated that a function of VGAM2608 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2608 include diagnosis, prevention and treatment of viral infection by Ljungan Virus. Specific functions, and accordingly utilities, of VGAM2608 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2608 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87994] Nucleotide sequences of the VGAM2608 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2608 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2608 are further described hereinbelow with reference to Table 1.

[87995] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2608 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2608 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87996] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2608 gene, herein designated VGAM is inhibition of expression of VGAM2608 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2608 correlate with, and may be deduced

from, the identity of the target genes which VGAM2608 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87997] DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892) is a VGAM2608 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13760, to the nucleotide sequence of VGAM2608 RNA, herein designated VGAM RNA, also designated SEQ ID:5319.

[87998] A function of VGAM2608 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM2608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM280.Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM2608 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21193, to the nucleotide sequence of VGAM2608 RNA, herein designated VGAM RNA, also designated SEQ ID:5319.

[87999] Another function of VGAM2608 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM2608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. LOC153196 (Accession XM_098323) is another VGAM2608 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, desig-

nated SEQ ID:41588, to the nucleotide sequence of VGAM2608 RNA, herein designated VGAM RNA, also designated SEQ ID:5319.

[88000] Another function of VGAM2608 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM2608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC255096 (Accession XM_174913) is another VGAM2608 host target gene. LOC255096 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255096 BINDING SITE, designated SEQ ID:46607, to the nucleotide sequence of VGAM2608 RNA, herein designated VGAM RNA, also designated SEQ ID:5319.

[88001] Another function of VGAM2608 is therefore inhibition of LOC255096 (Accession XM_174913). Accordingly, utilities of VGAM2608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255096. LOC256995 (Accession XM_174550) is another VGAM2608 host target gene. LOC256995 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256995, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256995 BINDING SITE, designated SEQ ID:46599, to the nucleotide sequence of VGAM2608 RNA, herein designated VGAM RNA, also designated SEQ ID:5319.

[88002] Another function of VGAM2608 is therefore inhibition of LOC256995 (Accession XM_174550). Accordingly, utilities of VGAM2608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256995. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2609 (VGAM2609) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88003] VGAM2609 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2609 was detected is described hereinabove with reference to Figs. 1-8.

[88004] VGAM2609 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ljungan Virus. VGAM2609 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88005] VGAM2609 gene encodes a VGAM2609 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2609 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2609 precursor RNA is designated SEQ ID:2595, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2595 is located at position 2766 relative to the genome of Ljungan Virus.

[88006] VGAM2609 precursor RNA folds onto itself, forming VGAM2609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[88007] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2609 folded precursor RNA into VGAM2609 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2609 RNA is designated SEQ ID:5320, and is provided hereinbelow with reference to the sequence listing part.

[88008] VGAM2609 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2609 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2609 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88009] VGAM2609 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2609 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2609 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2609 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2609 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88010] The complementary binding of VGAM2609 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2609 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2609 host target RNA into VGAM2609 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88011] It is appreciated that VGAM2609 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2609 host target genes. The mRNA of each one of this plurality of VGAM2609 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2609 RNA, herein designated VGAM RNA, and which when bound by VGAM2609 RNA causes inhibition of translation of respective one or more VGAM2609 host target proteins.

[88012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2609 gene, herein designated VGAM GENE, on one or more VGAM2609 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88013] It is yet further appreciated that a function of VGAM2609 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2609 include diagnosis, prevention and treatment of viral infection by Ljungan Virus. Specific functions, and accordingly utilities, of VGAM2609 correlate with, and may be deduced from, the identity of the host target genes which VGAM2609 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88014] Nucleotide sequences of the VGAM2609 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2609 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2609 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2609 are further described hereinbelow with reference to Table 1.

[88015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2609 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2609 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88016] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2609 gene, herein designated VGAM is inhibition of expression of VGAM2609 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2609 correlate with, and may be deduced from, the identity of the target genes which VGAM2609 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88017] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM2609 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7591, to the nucleotide sequence of VGAM2609 RNA, herein designated VGAM RNA, also designated SEQ ID:5320.

[88018] A function of VGAM2609 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM2609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19.MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587) is another VGAM2609 host target gene. MEF2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEF2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE,

designated SEQ ID:12115, to the nucleotide sequence of VGAM2609 RNA, herein designated VGAM RNA, also designated SEQ ID:5320.

[88019] Another function of VGAM2609 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of VGAM2609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2A. The function of MEF2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.Cbp/p300-interacting Transactivator, with Glu/Asp-rich Carboxy-terminal Domain, 2 (CITED2, Accession NM_006079) is another VGAM2609 host target gene. CITED2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CITED2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CITED2 BINDING SITE, designated SEQ ID:12727, to the nucleotide sequence of VGAM2609 RNA,

herein designated VGAM RNA, also designated SEQ ID:5320.

[88020] Another function of VGAM2609 is therefore inhibition of Cbp/p300-interacting Transactivator, with Glu/Asp-rich Carboxy-terminal Domain, 2 (CITED2, Accession NM_006079). Accordingly, utilities of VGAM2609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CITED2. FLJ20666 (Accession NM_018333) is another VGAM2609 host target gene. FLJ20666 BINDING SITE1 and FLJ20666 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20666, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE1 and FLJ20666 BINDING SITE2, designated SEQ ID:20336 and SEQ ID:19583 respectively, to the nucleotide sequence of VGAM2609 RNA, herein designated VGAM RNA, also designated SEQ ID:5320.

[88021] Another function of VGAM2609 is therefore inhibition of FLJ20666 (Accession NM_018333). Accordingly, utilities of VGAM2609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20666. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2610 (VGAM2610) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88022] VGAM2610 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2610 was detected is described hereinabove with reference to Figs. 1-8.

[88023] VGAM2610 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ljungan Virus. VGAM2610 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88024] VGAM2610 gene encodes a VGAM2610 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2610 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2610 precursor RNA is designated SEQ ID:2596, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2596 is located at position 7099 relative to the genome of Ljungan Virus.

[88025] VGAM2610 precursor RNA folds onto itself, forming VGAM2610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88026] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2610 folded precursor RNA into VGAM2610 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2610 RNA is designated SEQ ID:5321, and is provided hereinbelow with reference to the sequence listing part.

[88027] VGAM2610 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2610 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2610 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88028] VGAM2610 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2610 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2610 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2610 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2610 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88029] The complementary binding of VGAM2610 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2610 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2610 host target RNA into VGAM2610 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88030] It is appreciated that VGAM2610 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2610 host target genes. The mRNA of each one of this plurality of VGAM2610 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2610 RNA, herein designated VGAM RNA, and which when bound by VGAM2610 RNA causes

inhibition of translation of respective one or more VGAM2610 host target proteins.

[88031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2610 gene, herein designated VGAM GENE, on one or more VGAM2610 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88032] It is yet further appreciated that a function of VGAM2610 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2610 include diagnosis, prevention and

treatment of viral infection by Ljungan Virus. Specific functions, and accordingly utilities, of VGAM2610 correlate with, and may be deduced from, the identity of the host target genes which VGAM2610 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88033] Nucleotide sequences of the VGAM2610 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2610 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2610 are further described hereinbelow with reference to Table 1.

[88034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2610 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2610 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88035] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2610 gene, herein designated VGAM is inhibition of expression of VGAM2610 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2610 correlate with, and may be deduced from, the identity of the target genes which VGAM2610 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88036] FUS1 (Accession NM_007275) is a VGAM2610 host target gene. FUS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUS1 BINDING SITE, designated SEQ ID:14137, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88037] A function of VGAM2610 is therefore inhibition of FUS1 (Accession NM_007275), a gene which may function as a tumor suppressor. Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUS1. The function of FUS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1246.High-mobility Group Nucleosome Binding Do-

main 1 (HMGN1, Accession NM_004965) is another VGAM2610 host target gene. HMGN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGN1 BINDING SITE, designated SEQ ID:11413, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88038] Another function of VGAM2610 is therefore inhibition of High-mobility Group Nucleosome Binding Domain 1 (HMGN1, Accession NM_004965), a gene which binds to the inner side of the nucleosomal DNA and involves in transcriptional regulation. Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGN1. The function of HMGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Occludin (OCLN, Accession NM_002538) is another VGAM2610 host target gene. OCLN BINDING SITE is HOST TARGET binding site found in

the 5` untranslated region of mRNA encoded by OCLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCLN BINDING SITE, designated SEQ ID:8379, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88039] Another function of VGAM2610 is therefore inhibition of Occludin (OCLN, Accession NM_002538). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCLN. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Alpha (PIP5K1A, Accession NM_003557) is another VGAM2610 host target gene. PIP5K1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1A BINDING SITE, designated SEQ ID:9603, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88040] Another function of VGAM2610 is therefore inhibition of

Phosphatidylinositol-4-phosphate 5-kinase, Type I, Alpha (PIP5K1A, Accession NM_003557), a gene which is responsible for the synthesis of PtdIns(4,5)P2. Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1A. The function of PIP5K1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM427.Retinoid X Receptor, Alpha (RXRA, Accession NM_002957) is another VGAM2610 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8874, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88041] Another function of VGAM2610 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM_002957), a gene which activates genes required for vitamin A metabolism, binds 9-cis retinoic acid. Accordingly, utili-

ties of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA. The function of RXRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349.Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM_003038) is another VGAM2610 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8996, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88042] Another function of VGAM2610 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM2610 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859.Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM_017452) is another VGAM2610 host target gene. STAU BINDING SITE1 through STAU BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STAU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE1 through STAU BINDING SITE4, designated SEQ ID:18914, SEQ ID:10942, SEQ ID:18926 and SEQ ID:18920 respectively, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88043] Another function of VGAM2610 is therefore inhibition of Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM_017452), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with STAU. The function of STAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM916.Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133336) is another VGAM2610 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4, designated SEQ ID:28473, SEQ ID:28460, SEQ ID:28443 and SEQ ID:36468 respectively, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88044] Another function of VGAM2610 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133336), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1.

The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.DKFZP434O047 (Accession NM_015594) is another VGAM2610 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DK-FZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17869, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88045] Another function of VGAM2610 is therefore inhibition of DKFZP434O047 (Accession NM_015594). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. GBTS1 (Accession NM_145173) is another VGAM2610 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29728, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88046] Another function of VGAM2610 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. Heart and Neural Crest Derivatives Expressed 1 (HAND1, Accession NM_004821) is another VGAM2610 host target gene. HAND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAND1 BINDING SITE, designated SEQ ID:11237, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88047] Another function of VGAM2610 is therefore inhibition of Heart and Neural Crest Derivatives Expressed 1 (HAND1, Accession NM_004821). Accordingly, utilities of

VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAND1. KIAA0481 (Accession XM_050144) is another VGAM2610 host target gene. KIAA0481 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0481 BINDING SITE, designated SEQ ID:35570, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88048] Another function of VGAM2610 is therefore inhibition of KIAA0481 (Accession XM_050144). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0481. KIAA1554 (Accession XM_170834) is another VGAM2610 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1554 BINDING SITE, designated SEQ ID:45610, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88049] Another function of VGAM2610 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. Mitochondrial Ribosomal Protein L30 (MRPL30, Accession NM_016503) is another VGAM2610 host target gene. MRPL30 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MRPL30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL30 BINDING SITE, designated SEQ ID:18583, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88050] Another function of VGAM2610 is therefore inhibition of Mitochondrial Ribosomal Protein L30 (MRPL30, Accession NM_016503). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL30. P15-2 (Accession

NM_018698) is another VGAM2610 host target gene. P15-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P15-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P15-2 BINDING SITE, designated SEQ ID:20783, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88051] Another function of VGAM2610 is therefore inhibition of P15-2 (Accession NM_018698). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P15-2. Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM_006814) is another VGAM2610 host target gene. PSMF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSMF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMF1 BINDING SITE, designated SEQ ID:13689, to the nucleotide sequence of

VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88052] Another function of VGAM2610 is therefore inhibition of Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM_006814). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMF1. LOC115708 (Accession XM_056552) is another VGAM2610 host target gene. LOC115708 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115708 BINDING SITE, designated SEQ ID:36407, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88053] Another function of VGAM2610 is therefore inhibition of LOC115708 (Accession XM_056552). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115708. LOC145854 (Accession XM_085259) is another VGAM2610 host target gene. LOC145854 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145854 BINDING SITE, designated SEQ ID:38009, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88054] Another function of VGAM2610 is therefore inhibition of LOC145854 (Accession XM_085259). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145854. LOC150967 (Accession XM_087060) is another VGAM2610 host target gene. LOC150967 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150967 BINDING SITE, designated SEQ ID:39035, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88055] Another function of VGAM2610 is therefore inhibition of

LOC150967 (Accession XM_087060). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150967. LOC157624 (Accession XM_098801) is another VGAM2610 host target gene. LOC157624 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157624 BINDING SITE, designated SEQ ID:41826, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88056] Another function of VGAM2610 is therefore inhibition of LOC157624 (Accession XM_098801). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157624. LOC157918 (Accession XM_098842) is another VGAM2610 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41899, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88057] Another function of VGAM2610 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC158956 (Accession XM_039450) is another VGAM2610 host target gene. LOC158956 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158956 BINDING SITE, designated SEQ ID:33097, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88058] Another function of VGAM2610 is therefore inhibition of LOC158956 (Accession XM_039450). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158956. LOC197320 (Accession XM_113861) is an-

other VGAM2610 host target gene. LOC197320 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197320 BINDING SITE, designated SEQ ID:42472, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88059] Another function of VGAM2610 is therefore inhibition of LOC197320 (Accession XM_113861). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197320. LOC202025 (Accession XM_117353) is another VGAM2610 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43399, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88060] Another function of VGAM2610 is therefore inhibition of LOC202025 (Accession XM_117353). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202025. LOC206426 (Accession XM_116505) is another VGAM2610 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC206426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43120, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88061] Another function of VGAM2610 is therefore inhibition of LOC206426 (Accession XM_116505). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC222134 (Accession XM_168432) is another VGAM2610 host target gene. LOC222134 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222134, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222134 BINDING SITE, designated SEQ ID:45170, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88062] Another function of VGAM2610 is therefore inhibition of LOC222134 (Accession XM_168432). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222134. LOC255654 (Accession XM_173036) is another VGAM2610 host target gene. LOC255654 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255654 BINDING SITE, designated SEQ ID:46303, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88063] Another function of VGAM2610 is therefore inhibition of LOC255654 (Accession XM_173036). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255654. LOC257457 (Accession XM_031425) is another VGAM2610 host target gene. LOC257457 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257457 BINDING SITE, designated SEQ ID:31376, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88064] Another function of VGAM2610 is therefore inhibition of LOC257457 (Accession XM_031425). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257457. LOC51619 (Accession NM_015983) is another VGAM2610 host target gene. LOC51619 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51619 BINDING SITE, designated SEQ ID:18077, to the nucleotide sequence of VGAM2610 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5321.

[88065] Another function of VGAM2610 is therefore inhibition of LOC51619 (Accession NM_015983). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51619. LOC91759 (Accession XM_040467) is another VGAM2610 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33305, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88066] Another function of VGAM2610 is therefore inhibition of LOC91759 (Accession XM_040467). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759. LOC92539 (Accession XM_045632) is another VGAM2610 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92539, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34503, to the nucleotide sequence of VGAM2610 RNA, herein designated VGAM RNA, also designated SEQ ID:5321.

[88067] Another function of VGAM2610 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM2610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2611 (VGAM2611) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88068] VGAM2611 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2611 was detected is described hereinabove with reference to Figs. 1-8.

[88069] VGAM2611 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis A Virus.

VGAM2611 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88070] VGAM2611 gene encodes a VGAM2611 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2611 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2611 precursor RNA is designated SEQ ID:2597, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2597 is located at position 3057 relative to the genome of Equine Rhinitis A Virus.

[88071] VGAM2611 precursor RNA folds onto itself, forming VGAM2611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88072] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2611 folded precursor RNA into VGAM2611 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2611 RNA is designated SEQ ID:5322, and is provided hereinbelow with reference to the sequence listing part.

[88073] VGAM2611 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2611 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2611 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88074] VGAM2611 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2611 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2611 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2611 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2611 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88075] The complementary binding of VGAM2611 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2611 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2611 host target RNA into VGAM2611 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88076] It is appreciated that VGAM2611 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2611 host target genes. The mRNA of each one of this plurality of VGAM2611 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2611 RNA, herein designated VGAM RNA, and which when bound by VGAM2611 RNA causes inhibition of translation of respective one or more VGAM2611 host target proteins.

[88077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2611 gene, herein designated VGAM GENE, on one or more VGAM2611 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88078] It is yet further appreciated that a function of VGAM2611 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis A Virus. Specific functions, and accordingly utilities, of VGAM2611 correlate with, and may be deduced from, the identity of the host target genes which VGAM2611 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88079] Nucleotide sequences of the VGAM2611 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2611 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2611 are further described hereinbelow with reference to Table 1.

[88080] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2611 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2611 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88081] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2611 gene, herein designated VGAM is inhibition of expression of VGAM2611 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2611 correlate with, and may be deduced from, the identity of the target genes which VGAM2611 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88082] Arachidonate 15-lipoxygenase (ALOX15, Accession NM_001140) is a VGAM2611 host target gene. ALOX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALOX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALOX15 BINDING SITE, designated SEQ

ID:6809, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88083] A function of VGAM2611 is therefore inhibition of Arachidonate 15-lipoxygenase (ALOX15, Accession NM_001140), a gene which converts arachidonic acid to 15s- hydroperoxyeicosatetraenoic acid. Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALOX15. The function of ALOX15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM282.Adaptor-related Protein Complex 1, Gamma 1 Subunit (AP1G1, Accession NM_001128) is another VGAM2611 host target gene. AP1G1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1G1 BINDING SITE, designated SEQ ID:6799, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88084] Another function of VGAM2611 is therefore inhibition of Adaptor-related Protein Complex 1, Gamma 1 Subunit (AP1G1, Accession NM_001128), a gene which promotes the formation of clathrin-coated pits and vesicles. Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1G1. The function of AP1G1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316.Diaphorase (NADH) (cytochrome b-5 reductase) (DIA1, Accession NM_007326) is another VGAM2611 host target gene. DIA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DIA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIA1 BINDING SITE, designated SEQ ID:14246, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88085] Another function of VGAM2611 is therefore inhibition of Diaphorase (NADH) (cytochrome b-5 reductase) (DIA1, Accession NM_007326). Accordingly, utilities of

VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIA1. Discs, Large (Drosophila) Homolog 4 (DLG4, Accession NM_001365) is another VGAM2611 host target gene. DLG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DLG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG4 BINDING SITE, designated SEQ ID:7045, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88086] Another function of VGAM2611 is therefore inhibition of Discs, Large (Drosophila) Homolog 4 (DLG4, Accession NM_001365), a gene which is a membrane-associated guanylate kinase and may intervene in synaptogenesis. Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG4. The function of DLG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession

NM_021020) is another VGAM2611 host target gene. LZTS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LZTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:22006, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88087] Another function of VGAM2611 is therefore inhibition of Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM_021020), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76. Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1. The function of LZTS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM890.RAB, Member of RAS Oncogene Family-like 2A (RABL2A, Accession NM_013412) is another VGAM2611 host target gene. RABL2A BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by RABL2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL2A BINDING SITE, designated SEQ ID:15078, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88088] Another function of VGAM2611 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 2A (RABL2A, Accession NM_013412). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL2A. RAB, Member of RAS Oncogene Family-like 2B (RABL2B, Accession NM_007081) is another VGAM2611 host target gene. RABL2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABL2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL2B BINDING SITE, designated SEQ ID:13945, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5322.

[88089] Another function of VGAM2611 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 2B (RABL2B, Accession NM_007081). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL2B. Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM_003056) is another VGAM2611 host target gene. SLC19A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A1 BINDING SITE, designated SEQ ID:9021, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88090] Another function of VGAM2611 is therefore inhibition of Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM_003056). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A1. Serine Racemase (SRR, Accession NM_021947)

is another VGAM2611 host target gene. SRR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRR BINDING SITE, designated SEQ ID:22475, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88091] Another function of VGAM2611 is therefore inhibition of Serine Racemase (SRR, Accession NM_021947). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRR. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769) is another VGAM2611 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44784, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5322.

[88092] Another function of VGAM2611 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM2611 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:18999, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88093] Another function of VGAM2611 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. Chromosome 20 Open Reading Frame 102 (C20orf102, Acces-

sion NM_080607) is another VGAM2611 host target gene. C20orf102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf102 BINDING SITE, designated SEQ ID:27925, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88094] Another function of VGAM2611 is therefore inhibition of Chromosome 20 Open Reading Frame 102 (C20orf102, Accession NM_080607). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf102. Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586) is another VGAM2611 host target gene. C9orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf7 BINDING SITE, des-

ignated SEQ ID:19032, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88095] Another function of VGAM2611 is therefore inhibition of Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf7. FLJ12788 (Accession NM_022492) is another VGAM2611 host target gene. FLJ12788 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12788 BINDING SITE, designated SEQ ID:22872, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88096] Another function of VGAM2611 is therefore inhibition of FLJ12788 (Accession NM_022492). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12788. FLJ20211 (Accession NM_017713) is another

VGAM2611 host target gene. FLJ20211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20211 BINDING SITE, designated SEQ ID:19297, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88097] Another function of VGAM2611 is therefore inhibition of FLJ20211 (Accession NM_017713). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20211. FLJ20718 (Accession NM_017939) is another VGAM2611 host target gene. FLJ20718 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20718 BINDING SITE, designated SEQ ID:19634, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88098] Another function of VGAM2611 is therefore inhibition of FLJ20718 (Accession NM_017939). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20718. FLJ22215 (Accession XM_173021) is another VGAM2611 host target gene. FLJ22215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:46281, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88099] Another function of VGAM2611 is therefore inhibition of FLJ22215 (Accession XM_173021). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. FLJ32752 (Accession NM_144666) is another VGAM2611 host target gene. FLJ32752 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32752 BINDING SITE, designated SEQ ID:29481, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88100] Another function of VGAM2611 is therefore inhibition of FLJ32752 (Accession NM_144666). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32752. KIAA0367 (Accession XM_041018) is another VGAM2611 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33418, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88101] Another function of VGAM2611 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0367. KIAA0682 (Accession NM_016196) is another VGAM2611 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:18288, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88102] Another function of VGAM2611 is therefore inhibition of KIAA0682 (Accession NM_016196). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA0789 (Accession XM_033113) is another VGAM2611 host target gene. KIAA0789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:31846, to the nucleotide sequence of VGAM2611 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5322.

[88103] Another function of VGAM2611 is therefore inhibition of KIAA0789 (Accession XM_033113). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789. KIAA1862 (Accession XM_044212) is another VGAM2611 host target gene. KIAA1862 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1862 BINDING SITE, designated SEQ ID:34173, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88104] Another function of VGAM2611 is therefore inhibition of KIAA1862 (Accession XM_044212). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1862. Williams Beuren Syndrome Chromosome Region 21 (WBSCR21, Accession NM_031295) is another VGAM2611 host target gene. WBSCR21 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by WBSCR21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR21 BINDING SITE, designated SEQ ID:25327, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88105] Another function of VGAM2611 is therefore inhibition of Williams Beuren Syndrome Chromosome Region 21 (WBSCR21, Accession NM_031295). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR21. LOC143425 (Accession XM_113695) is another VGAM2611 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42351, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88106] Another function of VGAM2611 is therefore inhibition of

LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC146745 (Accession XM_085577) is another VGAM2611 host target gene. LOC146745 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146745, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146745 BINDING SITE, designated SEQ ID:38230, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88107] Another function of VGAM2611 is therefore inhibition of LOC146745 (Accession XM_085577). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146745. LOC152426 (Accession XM_098225) is another VGAM2611 host target gene. LOC152426 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:41496, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88108] Another function of VGAM2611 is therefore inhibition of LOC152426 (Accession XM_098225). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426. LOC157247 (Accession XM_088275) is another VGAM2611 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39573, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88109] Another function of VGAM2611 is therefore inhibition of LOC157247 (Accession XM_088275). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. LOC201182 (Accession XM_117055) is an-

other VGAM2611 host target gene. LOC201182 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201182 BINDING SITE, designated SEQ ID:43211, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88110] Another function of VGAM2611 is therefore inhibition of LOC201182 (Accession XM_117055). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201182. LOC201243 (Accession XM_113935) is another VGAM2611 host target gene. LOC201243 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201243 BINDING SITE, designated SEQ ID:42552, to the nucleotide sequence of VGAM2611 RNA, herein designated VGAM RNA, also designated SEQ ID:5322.

[88111] Another function of VGAM2611 is therefore inhibition of LOC201243 (Accession XM_113935). Accordingly, utilities of VGAM2611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201243. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2612 (VGAM2612) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88112] VGAM2612 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2612 was detected is described hereinabove with reference to Figs. 1-8.

[88113] VGAM2612 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis A Virus. VGAM2612 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88114] VGAM2612 gene encodes a VGAM2612 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2612 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2612 precursor RNA is designated SEQ ID:2598, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2598 is located at position 2734 relative to the genome of Equine Rhinitis A Virus.

[88115] VGAM2612 precursor RNA folds onto itself, forming VGAM2612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88116] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2612 folded precursor RNA into VGAM2612 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2612 RNA is designated SEQ ID:5323, and is provided hereinbelow with reference to the sequence listing part.

[88117] VGAM2612 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2612 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2612 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88118] VGAM2612 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2612 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2612 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2612 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2612 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88119] The complementary binding of VGAM2612 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2612 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2612 host target RNA into VGAM2612 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88120] It is appreciated that VGAM2612 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2612 host target genes. The mRNA of each one of this plurality of VGAM2612 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2612 RNA, herein designated VGAM RNA, and which when bound by VGAM2612 RNA causes inhibition of translation of respective one or more VGAM2612 host target proteins.

[88121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2612 gene, herein designated VGAM GENE, on one or more VGAM2612 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88122] It is yet further appreciated that a function of VGAM2612 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis A Virus. Specific functions, and accordingly utilities, of VGAM2612 correlate with, and may be deduced from, the identity of the host target genes which VGAM2612 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88123] Nucleotide sequences of the VGAM2612 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2612 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2612 are further described hereinbelow with reference to Table 1.

[88124] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2612 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2612 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[88125] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2612 gene, herein designated VGAM is inhibition of expression of VGAM2612 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2612 correlate with, and may be deduced from, the identity of the target genes which VGAM2612 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88126] Sialidase 3 (membrane sialidase) (NEU3, Accession NM_006656) is a VGAM2612 host target gene. NEU3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEU3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:13456, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88127] A function of VGAM2612 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM_006656). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with NEU3. SMP1 (Accession NM_014313) is another VGAM2612 host target gene. SMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMP1 BINDING SITE, designated SEQ ID:15609, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88128] Another function of VGAM2612 is therefore inhibition of SMP1 (Accession NM_014313), a gene which is a potential integral membrane protein. Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMP1. The function of SMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127.Zinc Finger Protein 289, ID1 Regulated (ZNF289, Accession XM_037147) is another VGAM2612 host target gene. ZNF289 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF289, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF289 BINDING SITE, designated SEQ ID:32550, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88129] Another function of VGAM2612 is therefore inhibition of Zinc Finger Protein 289, ID1 Regulated (ZNF289, Accession XM_037147). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF289. Apolipoprotein L, 2 (APOL2, Accession NM_030882) is another VGAM2612 host target gene. APOL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by APOL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL2 BINDING SITE, designated SEQ ID:25161, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88130] Another function of VGAM2612 is therefore inhibition of Apolipoprotein L, 2 (APOL2, Accession NM_030882). Ac-

cordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL2. Apolipoprotein L, 3 (APOL3, Accession NM_014349) is another VGAM2612 host target gene. APOL3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by APOL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL3 BINDING SITE, designated SEQ ID:15673, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88131] Another function of VGAM2612 is therefore inhibition of Apolipoprotein L, 3 (APOL3, Accession NM_014349). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL3. DKFZp434E2220 (Accession NM_017612) is another VGAM2612 host target gene. DKFZp434E2220 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:19109, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88132] Another function of VGAM2612 is therefore inhibition of DKFZp434E2220 (Accession NM_017612). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220. FLJ10388 (Accession NM_018082) is another VGAM2612 host target gene. FLJ10388 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10388 BINDING SITE, designated SEQ ID:19843, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88133] Another function of VGAM2612 is therefore inhibition of FLJ10388 (Accession NM_018082). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10388. KIAA0367 (Accession XM_041018) is another VGAM2612 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33415, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88134] Another function of VGAM2612 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA0871 (Accession NM_014961) is another VGAM2612 host target gene. KIAA0871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0871 BINDING SITE, designated SEQ ID:17330, to the nucleotide sequence of VGAM2612 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5323.

[88135] Another function of VGAM2612 is therefore inhibition of KIAA0871 (Accession NM_014961). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0871. KIAA0992 (Accession NM_016081) is another VGAM2612 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:18159, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88136] Another function of VGAM2612 is therefore inhibition of KIAA0992 (Accession NM_016081). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1028 (Accession XM_166324) is another VGAM2612 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44157, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88137] Another function of VGAM2612 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. KIAA1203 (Accession XM_049683) is another VGAM2612 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35470, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88138] Another function of VGAM2612 is therefore inhibition of KIAA1203 (Accession XM_049683). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1203. KIAA1954 (Accession XM_085375) is another VGAM2612 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38098, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88139] Another function of VGAM2612 is therefore inhibition of KIAA1954 (Accession XM_085375). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954. Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134) is another VGAM2612 host target gene. LMOD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LMOD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMOD1 BINDING SITE, designated SEQ

ID:14447, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88140] Another function of VGAM2612 is therefore inhibition of Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMOD1. MGC26914 (Accession NM_144976) is another VGAM2612 host target gene. MGC26914 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC26914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26914 BINDING SITE, designated SEQ ID:29586, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88141] Another function of VGAM2612 is therefore inhibition of MGC26914 (Accession NM_144976). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26914. PRO1617 (Accession NM_018587) is another

VGAM2612 host target gene. PRO1617 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1617 BINDING SITE, designated SEQ ID:20665, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88142] Another function of VGAM2612 is therefore inhibition of PRO1617 (Accession NM_018587). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1617. SKRP1 (Accession NM_080876) is another VGAM2612 host target gene. SKRP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SKRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKRP1 BINDING SITE, designated SEQ ID:28119, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88143] Another function of VGAM2612 is therefore inhibition of SKRP1 (Accession NM_080876). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKRP1. SPEC1 (Accession NM_020239) is another VGAM2612 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21510, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88144] Another function of VGAM2612 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. LOC144747 (Accession XM_084954) is another VGAM2612 host target gene. LOC144747 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144747, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144747 BINDING SITE, designated SEQ ID:37782, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88145] Another function of VGAM2612 is therefore inhibition of LOC144747 (Accession XM_084954). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144747. LOC158293 (Accession XM_088541) is another VGAM2612 host target gene. LOC158293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158293 BINDING SITE, designated SEQ ID:39806, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88146] Another function of VGAM2612 is therefore inhibition of LOC158293 (Accession XM_088541). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158293. LOC162239 (Accession XM_091439) is another VGAM2612 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40051, to the nucleotide sequence of VGAM2612 RNA, herein designated VGAM RNA, also designated SEQ ID:5323.

[88147] Another function of VGAM2612 is therefore inhibition of LOC162239 (Accession XM_091439). Accordingly, utilities of VGAM2612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2613 (VGAM2613) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88148] VGAM2613 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2613 was detected is described hereinabove with reference to Figs. 1-8.

[88149] VGAM2613 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis A Virus. VGAM2613 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88150] VGAM2613 gene encodes a VGAM2613 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2613 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2613 precursor RNA is designated SEQ ID:2599, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2599 is located at position 5479 relative to the genome of Equine Rhinitis A Virus.

[88151] VGAM2613 precursor RNA folds onto itself, forming VGAM2613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88152] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2613 folded precursor RNA into VGAM2613 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2613 RNA is designated SEQ ID:5324, and is provided hereinbelow with reference to the sequence listing part.

[88153] VGAM2613 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2613 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2613 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88154] VGAM2613 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2613 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2613 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2613 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2613 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88155] The complementary binding of VGAM2613 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2613 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2613 host target RNA into VGAM2613 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88156] It is appreciated that VGAM2613 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2613 host target genes. The mRNA of each one of this plurality of VGAM2613 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2613 RNA, herein designated VGAM RNA, and which when bound by VGAM2613 RNA causes inhibition of translation of respective one or more VGAM2613 host target proteins.

[88157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2613 gene, herein designated VGAM GENE, on one or more VGAM2613 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88158] It is yet further appreciated that a function of VGAM2613 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis A Virus. Specific functions, and accordingly utilities, of VGAM2613 correlate with, and may be deduced from, the identity of the host target genes which VGAM2613 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88159] Nucleotide sequences of the VGAM2613 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2613 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2613 are further described hereinbelow with reference to Table 1.

[88160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2613 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2613 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88161] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2613 gene, herein designated VGAM is inhibition of expression of VGAM2613 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2613 correlate with, and may be deduced from, the identity of the target genes which VGAM2613 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88162] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141) is a VGAM2613 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTNAP2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15414, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88163] A function of VGAM2613 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Down Syndrome Critical Region Gene 5 (DSCR5, Accession NM_016430) is another VGAM2613 host target gene. DSCR5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DSCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR5 BINDING SITE, designated SEQ ID:18549, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88164] Another function of VGAM2613 is therefore inhibition of

Down Syndrome Critical Region Gene 5 (DSCR5, Accession NM_016430), a gene which is expressed in liver, skeletal muscle, heart, pancreas and testis. Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR5. The function of DSCR5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1720.Forkhead Box M1 (FOXM1, Accession NM_021953) is another VGAM2613 host target gene. FOXM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXM1 BINDING SITE, designated SEQ ID:22483, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88165] Another function of VGAM2613 is therefore inhibition of Forkhead Box M1 (FOXM1, Accession NM_021953), a gene which may play a role in the control of cell proliferation. Accordingly, utilities of VGAM2613 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with FOXM1. The function of FOXM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM632.Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130837) is another VGAM2613 host target gene. OPA1 BINDING SITE1 through OPA1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OPA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA1 BINDING SITE1 through OPA1 BINDING SITE5, designated SEQ ID:28352, SEQ ID:28320, SEQ ID:28336, SEQ ID:28344 and SEQ ID:28328 respectively, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88166] Another function of VGAM2613 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130837). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. Protocadherin Alpha

11 (PCDHA11, Accession NM_031861) is another VGAM2613 host target gene. PCDHA11 BINDING SITE1 and PCDHA11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA11 BINDING SITE1 and PCDHA11 BINDING SITE2, designated SEQ ID:25621 and SEQ ID:11311 respectively, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88167] Another function of VGAM2613 is therefore inhibition of Protocadherin Alpha 11 (PCDHA11, Accession NM_031861). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA11. FLJ13657 (Accession NM_024828) is another VGAM2613 host target gene. FLJ13657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ13657 BINDING SITE, designated SEQ ID:24220, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88168] Another function of VGAM2613 is therefore inhibition of FLJ13657 (Accession NM_024828). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13657. KIAA0753 (Accession NM_014804) is another VGAM2613 host target gene. KIAA0753 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0753 BINDING SITE, designated SEQ ID:16736, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88169] Another function of VGAM2613 is therefore inhibition of KIAA0753 (Accession NM_014804). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0753. MAIL (Accession NM_031419) is another

VGAM2613 host target gene. MAIL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAIL BINDING SITE, designated SEQ ID:25405, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88170] Another function of VGAM2613 is therefore inhibition of MAIL (Accession NM_031419). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAIL. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255) is another VGAM2613 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22232, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88171] Another function of VGAM2613 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. LOC130026 (Accession NM_138468) is another VGAM2613 host target gene. LOC130026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130026 BINDING SITE, designated SEQ ID:28818, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88172] Another function of VGAM2613 is therefore inhibition of LOC130026 (Accession NM_138468). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130026. LOC200314 (Accession XM_117225) is another VGAM2613 host target gene. LOC200314 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200314, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200314 BINDING SITE, designated SEQ ID:43294, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88173] Another function of VGAM2613 is therefore inhibition of LOC200314 (Accession XM_117225). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200314. LOC55885 (Accession NM_018640) is another VGAM2613 host target gene. LOC55885 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC55885, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55885 BINDING SITE, designated SEQ ID:20711, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88174] Another function of VGAM2613 is therefore inhibition of LOC55885 (Accession NM_018640). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC55885. LOC92465 (Accession XM_045250) is another VGAM2613 host target gene. LOC92465 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92465 BINDING SITE, designated SEQ ID:34394, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88175] Another function of VGAM2613 is therefore inhibition of LOC92465 (Accession XM_045250). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92465. LOC93259 (Accession XM_050105) is another VGAM2613 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35559, to the

nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88176] Another function of VGAM2613 is therefore inhibition of LOC93259 (Accession XM_050105). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. LOC96597 (Accession XM_039922) is another VGAM2613 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33228, to the nucleotide sequence of VGAM2613 RNA, herein designated VGAM RNA, also designated SEQ ID:5324.

[88177] Another function of VGAM2613 is therefore inhibition of LOC96597 (Accession XM_039922). Accordingly, utilities of VGAM2613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2614 (VGAM2614) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88178] VGAM2614 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2614 was detected is described hereinabove with reference to Figs. 1-8.

[88179] VGAM2614 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis B Virus. VGAM2614 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88180] VGAM2614 gene encodes a VGAM2614 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2614 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2614 precursor RNA is designated SEQ ID:2600, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2600 is located at position 6330 relative to the genome of Equine Rhinitis B Virus.

[88181] VGAM2614 precursor RNA folds onto itself, forming VGAM2614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88182] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2614 folded precursor RNA into VGAM2614 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2614 RNA is designated SEQ ID:5325, and is provided hereinbelow with reference to the sequence listing part.

[88183] VGAM2614 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2614 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2614 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88184] VGAM2614 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2614 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2614 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2614 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2614 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88185] The complementary binding of VGAM2614 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2614 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2614 host target RNA into VGAM2614 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88186] It is appreciated that VGAM2614 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2614 host target genes. The mRNA of each one of this plurality of VGAM2614 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2614 RNA, herein designated VGAM RNA, and which when bound by VGAM2614 RNA causes inhibition of translation of respective one or more VGAM2614 host target proteins.

[88187] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2614 gene, herein designated VGAM GENE, on one or more VGAM2614 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88188] It is yet further appreciated that a function of VGAM2614 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2614 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis B Virus. Specific functions, and accordingly utilities, of VGAM2614 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2614 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88189] Nucleotide sequences of the VGAM2614 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2614 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2614 are further described hereinbelow with reference to Table 1.

[88190] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2614 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2614 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88191] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2614 gene, herein designated VGAM is inhibition of expression of VGAM2614 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2614 correlate with, and may be deduced from, the identity of the target genes which VGAM2614

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88192] EDR3 (Accession XM_172303) is a VGAM2614 host target gene. EDR3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EDR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR3 BINDING SITE, designated SEQ ID:46067, to the nucleotide sequence of VGAM2614 RNA, herein designated VGAM RNA, also designated SEQ ID:5325.

[88193] A function of VGAM2614 is therefore inhibition of EDR3 (Accession XM_172303). Accordingly, utilities of VGAM2614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR3. KIAA1393 (Accession XM_050793) is another VGAM2614 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35685, to the nucleotide sequence of

VGAM2614 RNA, herein designated VGAM RNA, also designated SEQ ID:5325.

[88194] Another function of VGAM2614 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities of VGAM2614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2615 (VGAM2615) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88195] VGAM2615 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2615 was detected is described hereinabove with reference to Figs. 1-8.

[88196] VGAM2615 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis B Virus. VGAM2615 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88197] VGAM2615 gene encodes a VGAM2615 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2615 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2615 precursor RNA is designated SEQ ID:2601, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2601 is located at position 2100 relative to the genome of Equine Rhinitis B Virus.

[88198] VGAM2615 precursor RNA folds onto itself, forming VGAM2615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88199] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2615 folded precursor RNA into VGAM2615 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2615 RNA is designated SEQ ID:5326, and is provided hereinbelow with reference to the sequence listing part.

[88200] VGAM2615 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2615 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2615 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88201] VGAM2615 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2615 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2615 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2615 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2615 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88202] The complementary binding of VGAM2615 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2615 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2615 host target RNA into VGAM2615 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88203] It is appreciated that VGAM2615 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2615 host target genes. The mRNA of each one of this plurality of VGAM2615 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2615 RNA, herein designated VGAM RNA, and which when bound by VGAM2615 RNA causes inhibition of translation of respective one or more VGAM2615 host target proteins.

[88204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2615 gene, herein designated VGAM GENE, on one or more VGAM2615 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88205] It is yet further appreciated that a function of VGAM2615 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis B Virus. Specific functions, and accordingly utilities, of VGAM2615 correlate with, and may be deduced from, the identity of the host target genes which VGAM2615 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88206] Nucleotide sequences of the VGAM2615 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2615 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2615 are further described hereinbelow with reference to Table 1.

[88207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2615 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2615 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88208] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2615 gene, herein designated VGAM is inhibition of expression of VGAM2615 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2615 correlate with, and may be deduced from, the identity of the target genes which VGAM2615 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88209] CD244 (Accession NM_016382) is a VGAM2615 host target gene. CD244 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD244 BINDING SITE, designated SEQ ID:18526, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88210] A function of VGAM2615 is therefore inhibition of CD244 (Accession NM_016382), a gene which can interfere with a

step as proximal as phosphorylation of an activation receptor. Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD244. The function of CD244 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is another VGAM2615 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41873, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88211] Another function of VGAM2615 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. FLJ11730 (Accession

NM_022756) is another VGAM2615 host target gene. FLJ11730 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:22993, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88212] Another function of VGAM2615 is therefore inhibition of FLJ11730 (Accession NM_022756). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM2615 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7856, to the nucleotide sequence of

VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88213] Another function of VGAM2615 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. KIAA0447 (Accession XM_049733) is another VGAM2615 host target gene. KIAA0447 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35494, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88214] Another function of VGAM2615 is therefore inhibition of KIAA0447 (Accession XM_049733). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. ZAK (Accession NM_133646) is another VGAM2615 host target gene. ZAK BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:28604, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88215] Another function of VGAM2615 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC115110 (Accession XM_049825) is another VGAM2615 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35510, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88216] Another function of VGAM2615 is therefore inhibition of

LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC197342 (Accession XM_113869) is another VGAM2615 host target gene. LOC197342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:42487, to the nucleotide sequence of VGAM2615 RNA, herein designated VGAM RNA, also designated SEQ ID:5326.

[88217] Another function of VGAM2615 is therefore inhibition of LOC197342 (Accession XM_113869). Accordingly, utilities of VGAM2615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2616 (VGAM2616) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[88218] VGAM2616 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2616 was detected is described hereinabove with reference to Figs. 1-8.

[88219] VGAM2616 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis B Virus. VGAM2616 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88220] VGAM2616 gene encodes a VGAM2616 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2616 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2616 precursor RNA is designated SEQ ID:2602, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2602 is located at position 4799 relative to the genome of Equine Rhinitis B Virus.

[88221] VGAM2616 precursor RNA folds onto itself, forming VGAM2616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88222] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2616 folded precursor RNA into VGAM2616 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2616 RNA is designated SEQ ID:5327, and is provided hereinbelow with reference to the sequence listing part.

[88223] VGAM2616 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2616 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2616 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88224] VGAM2616 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2616 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2616 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2616 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2616 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[88225] The complementary binding of VGAM2616 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2616 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2616 host target RNA into VGAM2616 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88226] It is appreciated that VGAM2616 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2616 host target genes. The mRNA of each one of this plurality of VGAM2616 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2616 RNA, herein designated VGAM RNA, and which when bound by VGAM2616 RNA causes inhibition of translation of respective one or more VGAM2616 host target proteins.

[88227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2616 gene, herein designated VGAM GENE, on one

or more VGAM2616 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88228] It is yet further appreciated that a function of VGAM2616 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2616 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis B Virus. Specific functions, and accordingly utilities, of VGAM2616 correlate with, and may be deduced from, the identity of the host target genes which VGAM2616 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88229] Nucleotide sequences of the VGAM2616 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2616 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2616 are further described hereinbelow with reference to Table 1.

[88230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2616 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2616 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88231] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2616 gene, herein designated VGAM is inhibition of expression of VGAM2616 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2616 correlate with, and may be deduced from, the identity of the target genes which VGAM2616 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88232] inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Acces-

sion NM_005536) is a VGAM2616 host target gene. IMPA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IMPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPA1 BINDING SITE, designated SEQ ID:12059, to the nucleotide sequence of VGAM2616 RNA, herein designated VGAM RNA, also designated SEQ ID:5327.

[88233] A function of VGAM2616 is therefore inhibition of inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM_005536), a gene which is responsible for the provision of inositol required for synthesis of phosphatidylinositol and polyphosphoinositides. Accordingly, utilities of VGAM2616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPA1. The function of IMPA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134.PHD Finger Protein 3 (PHF3, Accession NM_015153) is another VGAM2616 host target gene. PHF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHF3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHF3 BINDING SITE, designated SEQ ID:17511, to the nucleotide sequence of VGAM2616 RNA, herein designated VGAM RNA, also designated SEQ ID:5327.

[88234] Another function of VGAM2616 is therefore inhibition of PHD Finger Protein 3 (PHF3, Accession NM_015153). Accordingly, utilities of VGAM2616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF3. Testis-specific Transcript, Y-linked 9 (TTTY9, Accession NM_031927) is another VGAM2616 host target gene. TTTY9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTTY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTTY9 BINDING SITE, designated SEQ ID:25680, to the nucleotide sequence of VGAM2616 RNA, herein designated VGAM RNA, also designated SEQ ID:5327.

[88235] Another function of VGAM2616 is therefore inhibition of Testis-specific Transcript, Y-linked 9 (TTTY9, Accession

NM_031927). Accordingly, utilities of VGAM2616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY9. LOC124801 (Accession XM_058850) is another VGAM2616 host target gene. LOC124801 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124801 BINDING SITE, designated SEQ ID:36764, to the nucleotide sequence of VGAM2616 RNA, herein designated VGAM RNA, also designated SEQ ID:5327.

[88236] Another function of VGAM2616 is therefore inhibition of LOC124801 (Accession XM_058850). Accordingly, utilities of VGAM2616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124801. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2617 (VGAM2617) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[88237] VGAM2617 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2617 was detected is described hereinabove with reference to Figs. 1-8.

[88238] VGAM2617 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis B Virus. VGAM2617 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88239] VGAM2617 gene encodes a VGAM2617 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2617 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2617 precursor RNA is designated SEQ ID:2603, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2603 is located at position 8196 relative to the genome of Equine Rhinitis B Virus.

[88240] VGAM2617 precursor RNA folds onto itself, forming VGAM2617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88241] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2617 folded precursor RNA into VGAM2617 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2617 RNA is designated SEQ ID:5328, and is provided hereinbelow with reference to the sequence listing part.

[88242] VGAM2617 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2617 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2617 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88243] VGAM2617 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2617 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2617 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2617 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2617 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[88244] The complementary binding of VGAM2617 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2617 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2617 host target RNA into VGAM2617 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88245] It is appreciated that VGAM2617 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2617 host target genes. The mRNA of each one of this plurality of VGAM2617 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2617 RNA, herein designated VGAM RNA, and which when bound by VGAM2617 RNA causes inhibition of translation of respective one or more VGAM2617 host target proteins.

[88246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2617 gene, herein designated VGAM GENE, on one

or more VGAM2617 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88247] It is yet further appreciated that a function of VGAM2617 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis B Virus. Specific functions, and accordingly utilities, of VGAM2617 correlate with, and may be deduced from, the identity of the host target genes which VGAM2617 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88248] Nucleotide sequences of the VGAM2617 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2617 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2617 are further described hereinbelow with reference to Table 1.

[88249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2617 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2617 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2617 gene, herein designated VGAM is inhibition of expression of VGAM2617 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2617 correlate with, and may be deduced from, the identity of the target genes which VGAM2617 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88251] Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession

XM_033096) is a VGAM2617 host target gene. CLTCL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLTCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLTCL1 BINDING SITE, designated SEQ ID:31837, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88252] A function of VGAM2617 is therefore inhibition of Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM_033096), a gene which is involved in vesicle budding. Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLTCL1. The function of CLTCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.V-crk Sarcoma Virus CT10 Oncogene Homolog (avian)-like (CRKL, Accession NM_005207) is another VGAM2617 host target gene. CRKL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CRKL, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRKL BINDING SITE, designated SEQ ID:11708, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88253] Another function of VGAM2617 is therefore inhibition of V-crk Sarcoma Virus CT10 Oncogene Homolog (avian)-like (CRKL, Accession NM_005207). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRKL. 24-dehydrocholesterol Reductase (DHCR24, Accession NM_014762) is another VGAM2617 host target gene. DHCR24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:16527, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88254] Another function of VGAM2617 is therefore inhibition of 24-dehydrocholesterol Reductase (DHCR24, Accession

NM_014762), a gene which catalyzes the reduction of sterol intermediates. Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR24. The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM235.Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM2617 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14490, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88255] Another function of VGAM2617 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM2617 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107) is another VGAM2617 host target gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9077, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88256] Another function of VGAM2617 is therefore inhibition of SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaaag-3' motif. Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM409.BDG-29 (Accession XM_051343) is another VGAM2617 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35820, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88257] Another function of VGAM2617 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. FLJ21687 (Accession NM_024859) is another VGAM2617 host target gene. FLJ21687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21687 BINDING SITE, designated SEQ ID:24291, to the nucleotide

sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88258] Another function of VGAM2617 is therefore inhibition of FLJ21687 (Accession NM_024859). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21687. poly(rC) Binding Protein 4 (PCBP4, Accession NM_020418) is another VGAM2617 host target gene. PCBP4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCBP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:21678, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88259] Another function of VGAM2617 is therefore inhibition of poly(rC) Binding Protein 4 (PCBP4, Accession NM_020418). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4. PIF1 (Accession XM_027898) is another VGAM2617 host target gene. PIF1 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIF1 BINDING SITE, designated SEQ ID:30588, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88260] Another function of VGAM2617 is therefore inhibition of PIF1 (Accession XM_027898). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIF1. SHARP (Accession NM_015001) is another VGAM2617 host target gene. SHARP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHARP BINDING SITE, designated SEQ ID:17369, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88261] Another function of VGAM2617 is therefore inhibition of

SHARP (Accession NM_015001). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHARP. LOC123096 (Accession XM_058679) is another VGAM2617 host target gene. LOC123096 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC123096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123096 BINDING SITE, designated SEQ ID:36722, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88262] Another function of VGAM2617 is therefore inhibition of LOC123096 (Accession XM_058679). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123096. LOC155438 (Accession XM_098722) is another VGAM2617 host target gene. LOC155438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC155438 BINDING SITE, designated SEQ ID:41768, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88263] Another function of VGAM2617 is therefore inhibition of LOC155438 (Accession XM_098722). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155438. LOC220110 (Accession XM_167882) is another VGAM2617 host target gene. LOC220110 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220110 BINDING SITE, designated SEQ ID:44895, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88264] Another function of VGAM2617 is therefore inhibition of LOC220110 (Accession XM_167882). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220110. LOC254219 (Accession XM_172913) is an-

other VGAM2617 host target gene. LOC254219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254219 BINDING SITE, designated SEQ ID:46174, to the nucleotide sequence of VGAM2617 RNA, herein designated VGAM RNA, also designated SEQ ID:5328.

[88265] Another function of VGAM2617 is therefore inhibition of LOC254219 (Accession XM_172913). Accordingly, utilities of VGAM2617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254219. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2618 (VGAM2618) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88266] VGAM2618 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2618 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[88267] VGAM2618 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis B Virus. VGAM2618 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88268] VGAM2618 gene encodes a VGAM2618 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2618 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2618 precursor RNA is designated SEQ ID:2604, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2604 is located at position 6170 relative to the genome of Equine Rhinitis B Virus.

[88269] VGAM2618 precursor RNA folds onto itself, forming VGAM2618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88270] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2618 folded precursor RNA into VGAM2618 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2618 RNA is designated SEQ ID:5329, and is provided hereinbelow with reference to the sequence listing part.

[88271] VGAM2618 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2618 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2618 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88272] VGAM2618 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2618 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2618 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2618 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2618 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88273] The complementary binding of VGAM2618 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2618 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2618 host target RNA into VGAM2618 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88274] It is appreciated that VGAM2618 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2618 host target genes. The mRNA of each one of this plurality of VGAM2618 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2618 RNA, herein designated VGAM RNA, and which when bound by VGAM2618 RNA causes inhibition of translation of respective one or more VGAM2618 host target proteins.

[88275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2618 gene, herein designated VGAM GENE, on one or more VGAM2618 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88276] It is yet further appreciated that a function of VGAM2618 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis B Virus. Specific functions, and accordingly utilities, of VGAM2618 correlate with, and may be deduced from, the identity of the host target genes which VGAM2618 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88277] Nucleotide sequences of the VGAM2618 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2618 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2618 are further described hereinbelow with reference to Table 1.

[88278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2618 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2618 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88279] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2618 gene, herein designated VGAM is inhibition of expression of VGAM2618 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2618 correlate with, and may be deduced from, the identity of the target genes which VGAM2618 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88280] Dehydrogenase/reductase (SDR family) Member 2 (DHRS2, Accession NM_005794) is a VGAM2618 host target gene. DHRS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DHRS2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHRS2 BINDING SITE, designated SEQ ID:12374, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88281] A function of VGAM2618 is therefore inhibition of Dehydrogenase/reductase (SDR family) Member 2 (DHRS2, Accession NM_005794). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHRS2. GREB1 (Accession XM_051545) is another VGAM2618 host target gene. GREB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:35852, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88282] Another function of VGAM2618 is therefore inhibition of GREB1 (Accession XM_051545). Accordingly, utilities of

VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. KIAA0286 (Accession XM_043118) is another VGAM2618 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33905, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88283] Another function of VGAM2618 is therefore inhibition of KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0565 (Accession XM_039912) is another VGAM2618 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0565 BINDING SITE, designated SEQ ID:33217, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88284] Another function of VGAM2618 is therefore inhibition of KIAA0565 (Accession XM_039912). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. PRO1600 (Accession NM_014095) is another VGAM2618 host target gene. PRO1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1600 BINDING SITE, designated SEQ ID:15314, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88285] Another function of VGAM2618 is therefore inhibition of PRO1600 (Accession NM_014095). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1600. LOC148824 (Accession XM_097527) is another VGAM2618 host target gene. LOC148824 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148824 BINDING SITE, designated SEQ ID:40908, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88286] Another function of VGAM2618 is therefore inhibition of LOC148824 (Accession XM_097527). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824. LOC157292 (Accession XM_098740) is another VGAM2618 host target gene. LOC157292 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157292 BINDING SITE, designated SEQ ID:41775, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88287] Another function of VGAM2618 is therefore inhibition of

LOC157292 (Accession XM_098740). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157292. LOC157507 (Accession XM_088312) is another VGAM2618 host target gene. LOC157507 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:39604, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88288] Another function of VGAM2618 is therefore inhibition of LOC157507 (Accession XM_088312). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157507. LOC201287 (Accession XM_113947) is another VGAM2618 host target gene. LOC201287 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC201287 BINDING SITE, designated SEQ ID:42560, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88289] Another function of VGAM2618 is therefore inhibition of LOC201287 (Accession XM_113947). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201287. LOC254082 (Accession XM_173165) is another VGAM2618 host target gene. LOC254082 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254082 BINDING SITE, designated SEQ ID:46421, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88290] Another function of VGAM2618 is therefore inhibition of LOC254082 (Accession XM_173165). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254082. LOC256207 (Accession XM_170837) is an-

other VGAM2618 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45618, to the nucleotide sequence of VGAM2618 RNA, herein designated VGAM RNA, also designated SEQ ID:5329.

[88291] Another function of VGAM2618 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM2618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256207. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2619 (VGAM2619) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88292] VGAM2619 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2619 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[88293] VGAM2619 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Rhinitis B Virus. VGAM2619 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88294] VGAM2619 gene encodes a VGAM2619 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2619 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2619 precursor RNA is designated SEQ ID:2605, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2605 is located at position 4452 relative to the genome of Equine Rhinitis B Virus.

[88295] VGAM2619 precursor RNA folds onto itself, forming VGAM2619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88296] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2619 folded precursor RNA into VGAM2619 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2619 RNA is designated SEQ ID:5330, and is provided hereinbelow with reference to the sequence listing part.

[88297] VGAM2619 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2619 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2619 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88298] VGAM2619 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2619 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2619 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2619 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2619 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88299] The complementary binding of VGAM2619 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2619 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2619 host target RNA into VGAM2619 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88300] It is appreciated that VGAM2619 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2619 host target genes. The mRNA of each one of this plurality of VGAM2619 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2619 RNA, herein designated VGAM RNA, and which when bound by VGAM2619 RNA causes inhibition of translation of respective one or more VGAM2619 host target proteins.

[88301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2619 gene, herein designated VGAM GENE, on one or more VGAM2619 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88302] It is yet further appreciated that a function of VGAM2619 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2619 include diagnosis, prevention and treatment of viral infection by Equine Rhinitis B Virus. Specific functions, and accordingly utilities, of VGAM2619 correlate with, and may be deduced from, the identity of the host target genes which VGAM2619 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88303] Nucleotide sequences of the VGAM2619 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2619 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2619 are further described hereinbelow with reference to Table 1.

[88304] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2619 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2619 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88305] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2619 gene, herein designated VGAM is inhibition of expression of VGAM2619 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2619 correlate with, and may be deduced from, the identity of the target genes which VGAM2619 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88306] NKX3A (Accession NM_006167) is a VGAM2619 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12825, to the nucleotide sequence of VGAM2619 RNA, herein designated VGAM RNA, also designated SEQ ID:5330.

[88307] A function of VGAM2619 is therefore inhibition of NKX3A (Accession NM_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM2619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133336) is another VGAM2619 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:28478, to the nucleotide sequence of VGAM2619 RNA, herein designated VGAM RNA,

also designated SEQ ID:5330.

[88308] Another function of VGAM2619 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133336), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM2619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.DKFZP564K1964 (Accession NM_015544) is another VGAM2619 host target gene. DKFZP564K1964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K1964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564K1964 BINDING SITE, designated SEQ ID:17805, to the nucleotide sequence of VGAM2619 RNA, herein designated VGAM RNA, also designated SEQ ID:5330.

[88309] Another function of VGAM2619 is therefore inhibition of DKFZP564K1964 (Accession NM_015544). Accordingly,

utilities of VGAM2619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K1964. P114-RHO-GEF (Accession NM_015318) is another VGAM2619 host target gene. P114-RHO-GEF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P114-RHO-GEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P114-RHO-GEF BINDING SITE, designated SEQ ID:17636, to the nucleotide sequence of VGAM2619 RNA, herein designated VGAM RNA, also designated SEQ ID:5330.

[88310] Another function of VGAM2619 is therefore inhibition of P114-RHO-GEF (Accession NM_015318). Accordingly, utilities of VGAM2619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P114-RHO-GEF. LOC221042 (Accession XM_167669) is another VGAM2619 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44750, to the nucleotide sequence of VGAM2619 RNA, herein designated VGAM RNA, also designated SEQ ID:5330.

[88311] Another function of VGAM2619 is therefore inhibition of LOC221042 (Accession XM_167669). Accordingly, utilities of VGAM2619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2620 (VGAM2620) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88312] VGAM2620 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2620 was detected is described hereinabove with reference to Figs. 1-8.

[88313] VGAM2620 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Enterovirus A (PEV8). VGAM2620 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88314] VGAM2620 gene encodes a VGAM2620 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2620 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2620 precursor RNA is designated SEQ ID:2606, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2606 is located at position 2601 relative to the genome of Porcine Enterovirus A (PEV8).

[88315] VGAM2620 precursor RNA folds onto itself, forming VGAM2620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88316] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2620 folded precursor RNA into VGAM2620

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM2620 RNA is designated SEQ ID:5331, and is provided hereinbelow with reference to the sequence listing part.

[88317] VGAM2620 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2620 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2620 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88318] VGAM2620 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2620 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2620 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2620 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2620 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88319] The complementary binding of VGAM2620 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2620 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2620 host target RNA into VGAM2620 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[88320] It is appreciated that VGAM2620 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2620 host target genes. The mRNA of each one of this plurality of VGAM2620 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2620 RNA, herein designated VGAM RNA, and which when bound by VGAM2620 RNA causes inhibition of translation of respective one or more VGAM2620 host target proteins.

[88321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2620 gene, herein designated VGAM GENE, on one or more VGAM2620 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88322] It is yet further appreciated that a function of VGAM2620 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of viral infection by Porcine Enterovirus A (PEV8). Specific functions, and accordingly utilities, of VGAM2620 correlate with, and may be deduced from, the identity of the host target genes which VGAM2620 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88323] Nucleotide sequences of the VGAM2620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2620 are further described hereinbelow with reference to Table 1.

[88324] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2620 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2620 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88325] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2620 gene, herein designated VGAM is inhibition of expression of VGAM2620 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2620 correlate with, and may be deduced from, the identity of the target genes which VGAM2620 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88326] CDC7 Cell Division Cycle 7-like 1 (S. cerevisiae) (CDC7L1, Accession NM_003503) is a VGAM2620 host target gene. CDC7L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC7L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC7L1 BINDING SITE, designated SEQ ID:9591, to the nucleotide sequence of VGAM2620 RNA,

herein designated VGAM RNA, also designated SEQ ID:5331.

[88327] A function of VGAM2620 is therefore inhibition of CDC7 Cell Division Cycle 7-like 1 (S. cerevisiae) (CDC7L1, Accession NM_003503), a gene which may phosphorylate critical substrates that regulate the G1/S phase transition and/or DNA replication in mammalian cells. Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC7L1. The function of CDC7L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1431.Olfactomedin 1 (OLFM1, Accession NM_014279) is another VGAM2620 host target gene. OLFM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OLFM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM1 BINDING SITE, designated SEQ ID:15557, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88328] Another function of VGAM2620 is therefore inhibition of Olfactomedin 1 (OLFM1, Accession NM_014279). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM1. Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_002641) is another VGAM2620 host target gene. PIGA BINDING SITE1 through PIGA BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1 through PIGA BINDING SITE3, designated SEQ ID:8498, SEQ ID:21711 and SEQ ID:21718 respectively, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88329] Another function of VGAM2620 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_002641). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGA. FLJ14621 (Accession NM_032811) is

another VGAM2620 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26582, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88330] Another function of VGAM2620 is therefore inhibition of FLJ14621 (Accession NM_032811). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. KIAA1033 (Accession XM_035313) is another VGAM2620 host target gene. KIAA1033 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1033 BINDING SITE, designated SEQ ID:32229, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88331] Another function of VGAM2620 is therefore inhibition of KIAA1033 (Accession XM_035313). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1033. KIAA1128 (Accession XM_043596) is another VGAM2620 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33967, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88332] Another function of VGAM2620 is therefore inhibition of KIAA1128 (Accession XM_043596). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. MGC5590 (Accession NM_024058) is another VGAM2620 host target gene. MGC5590 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5590, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5590 BINDING SITE, designated SEQ ID:23495, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88333] Another function of VGAM2620 is therefore inhibition of MGC5590 (Accession NM_024058). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5590. Phosphodiesterase 10A (PDE10A, Accession NM_006661) is another VGAM2620 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:13463, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88334] Another function of VGAM2620 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM_006661). Accordingly, utilities of VGAM2620 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PDE10A. Tripartite Motif-containing 2 (TRIM2, Accession NM_015271) is another VGAM2620 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17597, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88335] Another function of VGAM2620 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM_015271). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. LOC146159 (Accession XM_085344) is another VGAM2620 host target gene. LOC146159 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC146159 BINDING SITE, designated SEQ ID:38075, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88336] Another function of VGAM2620 is therefore inhibition of LOC146159 (Accession XM_085344). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146159. LOC152559 (Accession XM_087487) is another VGAM2620 host target gene. LOC152559 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152559 BINDING SITE, designated SEQ ID:39282, to the nucleotide sequence of VGAM2620 RNA, herein designated VGAM RNA, also designated SEQ ID:5331.

[88337] Another function of VGAM2620 is therefore inhibition of LOC152559 (Accession XM_087487). Accordingly, utilities of VGAM2620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152559. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2621 (VGAM2621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88338] VGAM2621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2621 was detected is described hereinabove with reference to Figs. 1-8.

[88339] VGAM2621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Enterovirus A (PEV8). VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88340] VGAM2621 gene encodes a VGAM2621 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2621 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2621 precursor RNA is designated SEQ ID:2607, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2607 is located at position 6168 relative to the genome of Porcine Enterovirus A (PEV8).

[88341] VGAM2621 precursor RNA folds onto itself, forming VGAM2621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88342] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2621 folded precursor RNA into VGAM2621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2621 RNA is designated SEQ ID:5332, and is provided hereinbelow with reference to the sequence listing part.

[88343] VGAM2621 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2621 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88344] VGAM2621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2621 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2621 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2621 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88345] The complementary binding of VGAM2621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2621 host target RNA into VGAM2621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88346] It is appreciated that VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2621 host target genes. The mRNA of each one of this plurality of VGAM2621 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2621 RNA, herein designated VGAM RNA, and which when bound by VGAM2621 RNA causes inhibition of translation of respective one or more

VGAM2621 host target proteins.

[88347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2621 gene, herein designated VGAM GENE, on one or more VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88348] It is yet further appreciated that a function of VGAM2621 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2621 include diagnosis, prevention and treatment of viral infection by Porcine Enterovirus A

(PEV8). Specific functions, and accordingly utilities, of VGAM2621 correlate with, and may be deduced from, the identity of the host target genes which VGAM2621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88349] Nucleotide sequences of the VGAM2621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2621 are further described hereinbelow with reference to Table 1.

[88350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2621 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88351] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2621 gene, herein designated VGAM is inhibition of expression of VGAM2621 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2621 correlate with, and may be deduced from, the identity of the target genes which VGAM2621 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88352] KIAA0884 (Accession XM_046660) is a VGAM2621 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34770, to the nucleotide sequence of VGAM2621 RNA, herein designated VGAM RNA, also designated SEQ ID:5332.

[88353] A function of VGAM2621 is therefore inhibition of KIAA0884 (Accession XM_046660). Accordingly, utilities of VGAM2621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. LOC130507 (Accession XM_059440) is another VGAM2621 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:36995, to the nucleotide sequence of VGAM2621 RNA, herein designated VGAM RNA, also designated SEQ ID:5332.

[88354] Another function of VGAM2621 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM2621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC221710 (Accession XM_166471) is another VGAM2621 host target gene. LOC221710 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221710 BINDING SITE, designated SEQ ID:44395, to the nucleotide sequence of VGAM2621 RNA, herein designated VGAM RNA, also designated SEQ ID:5332.

[88355] Another function of VGAM2621 is therefore inhibition of LOC221710 (Accession XM_166471). Accordingly, utilities of VGAM2621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221710. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2622 (VGAM2622) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88356] VGAM2622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2622 was detected is described hereinabove with reference to Figs. 1-8.

[88357] VGAM2622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Enterovirus A (PEV8). VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88358] VGAM2622 gene encodes a VGAM2622 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2622 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2622 precursor RNA is designated SEQ ID:2608, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2608 is located at position 3608 relative to the genome of Porcine Enterovirus A (PEV8).

[88359] VGAM2622 precursor RNA folds onto itself, forming VGAM2622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88360] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2622 folded precursor RNA into VGAM2622 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2622 RNA is designated SEQ ID:5333, and is provided hereinbelow with reference to the sequence listing part.

[88361] VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2622 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88362] VGAM2622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2622 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2622 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88363] The complementary binding of VGAM2622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2622 host target RNA into VGAM2622 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88364] It is appreciated that VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2622 host target genes. The mRNA of each one of this plurality of VGAM2622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2622 RNA, herein designated VGAM RNA, and which when bound by VGAM2622 RNA causes

inhibition of translation of respective one or more VGAM2622 host target proteins.

[88365] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2622 gene, herein designated VGAM GENE, on one or more VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88366] It is yet further appreciated that a function of VGAM2622 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2622 include diagnosis, prevention and

treatment of viral infection by Porcine Enterovirus A (PEV8). Specific functions, and accordingly utilities, of VGAM2622 correlate with, and may be deduced from, the identity of the host target genes which VGAM2622 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88367] Nucleotide sequences of the VGAM2622 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2622 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2622 are further described hereinbelow with reference to Table 1.

[88368] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2622 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2622 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88369] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2622 gene, herein designated VGAM is inhibition of expression of VGAM2622 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2622 correlate with, and may be deduced from, the identity of the target genes which VGAM2622 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88370] Secreted Protein, Acidic, Cysteine-rich (osteonectin) (SPARC, Accession NM_003118) is a VGAM2622 host target gene. SPARC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPARC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPARC BINDING SITE, designated SEQ ID:9088, to the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, also designated SEQ ID:5333.

[88371] A function of VGAM2622 is therefore inhibition of Secreted Protein, Acidic, Cysteine-rich (osteonectin) (SPARC, Accession NM_003118), a gene which .appears to regulate cell growth through interactions with the extracellular matrix and cytokines. binds calcium and copper, several types of collagen, albumin, thrombospondin, pdgf and cell membranes. Accordingly, utilities of VGAM2622 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SPARC. The function of SPARC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652.FLJ12592 (Accession NM_032169) is another VGAM2622 host target gene. FLJ12592 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12592 BINDING SITE, designated SEQ ID:25873, to the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, also designated SEQ ID:5333.

[88372] Another function of VGAM2622 is therefore inhibition of FLJ12592 (Accession NM_032169). Accordingly, utilities of VGAM2622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12592. FLJ25359 (Accession NM_144587) is another VGAM2622 host target gene. FLJ25359 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ25359, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25359 BINDING SITE, designated SEQ ID:29407, to the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, also designated SEQ ID:5333.

[88373] Another function of VGAM2622 is therefore inhibition of FLJ25359 (Accession NM_144587). Accordingly, utilities of VGAM2622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25359. KIAA1155 (Accession XM_030864) is another VGAM2622 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31199, to the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, also designated SEQ ID:5333.

[88374] Another function of VGAM2622 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities of VGAM2622 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1155. MGC2474 (Accession NM_023931) is another VGAM2622 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23420, to the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, also designated SEQ ID:5333.

[88375] Another function of VGAM2622 is therefore inhibition of MGC2474 (Accession NM_023931). Accordingly, utilities of VGAM2622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. Suppression of Tumorigenicity 13 (colon carcinoma) (Hsp70 interacting protein) (ST13, Accession NM_003932) is another VGAM2622 host target gene. ST13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ST13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ST13 BINDING SITE, designated SEQ ID:10034, to the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, also designated SEQ ID:5333.

[88376] Another function of VGAM2622 is therefore inhibition of Suppression of Tumorigenicity 13 (colon carcinoma) (Hsp70 interacting protein) (ST13, Accession NM_003932). Accordingly, utilities of VGAM2622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST13. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2623 (VGAM2623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88377] VGAM2623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2623 was detected is described hereinabove with reference to Figs. 1-8.

[88378] VGAM2623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 Plaque Virus. VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[88379] VGAM2623 gene encodes a VGAM2623 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2623 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2623 precursor RNA is designated SEQ ID:2609, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2609 is located at position 4786 relative to the genome of A-2 Plaque Virus.

[88380] VGAM2623 precursor RNA folds onto itself, forming VGAM2623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88381] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2623 folded precursor RNA into VGAM2623 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2623 RNA is designated SEQ ID:5334, and is provided hereinbelow with reference to the sequence listing part.

[88382] VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2623 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88383] VGAM2623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2623 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2623 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88384] The complementary binding of VGAM2623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2623 host target RNA into VGAM2623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88385] It is appreciated that VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2623 host target genes. The mRNA of each one of this plurality of VGAM2623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2623 RNA, herein designated VGAM RNA, and which when bound by VGAM2623 RNA causes inhibition of translation of respective one or more VGAM2623 host target proteins.

[88386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2623 gene, herein designated VGAM GENE, on one or more VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88387] It is yet further appreciated that a function of VGAM2623 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific functions, and accordingly utilities, of VGAM2623 correlate with, and may be deduced from, the identity of the host target genes which VGAM2623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88388] Nucleotide sequences of the VGAM2623 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2623 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2623 are further described hereinbelow with reference to Table 1.

[88389] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2623 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2623 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88390] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2623 gene, herein designated VGAM is inhibition of expression of VGAM2623 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2623 correlate with, and may be deduced from, the identity of the target genes which VGAM2623 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88391] Chorionic Gonadotropin, Beta Polypeptide (CGB, Accession NM_000737) is a VGAM2623 host target gene. CGB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB BINDING SITE, designated SEQ ID:6393, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88392] A function of VGAM2623 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide (CGB, Accession NM_000737), a gene which stimulates the ovaries to synthesize the steroids. Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB. The function of CGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Guanine Nucleotide Binding Protein (G protein), Alpha Activating Activity Polypeptide O (GNAO1, Accession XM_165653) is another VGAM2623 host target gene. GNAO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNAO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAO1 BINDING SITE, designated SEQ ID:43720, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88393] Another function of VGAM2623 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Ac-

tivating Activity Polypeptide O (GNAO1, Accession XM_165653), a gene which functions as modulators or transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAO1. The function of GNAO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Microfibrillar-associated Protein 3 (MFAP3, Accession NM_005927) is another VGAM2623 host target gene. MFAP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MFAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFAP3 BINDING SITE, designated SEQ ID:12554, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88394] Another function of VGAM2623 is therefore inhibition of Microfibrillar-associated Protein 3 (MFAP3, Accession NM_005927). Accordingly, utilities of VGAM2623 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MFAP3. MAX Binding Protein (MNT, Accession NM_020310) is another VGAM2623 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21561, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88395] Another function of VGAM2623 is therefore inhibition of MAX Binding Protein (MNT, Accession NM_020310). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868) is another VGAM2623 host target gene. SLC9A5 BINDING SITE1 and SLC9A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC9A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A5 BINDING SITE1 and SLC9A5 BINDING SITE2, designated SEQ ID:30063 and SEQ ID:10934 respectively, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88396] Another function of VGAM2623 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A5. Thy-1 Cell Surface Antigen (THY1, Accession NM_006288) is another VGAM2623 host target gene. THY1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THY1 BINDING SITE, designated SEQ ID:12976, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88397] Another function of VGAM2623 is therefore inhibition of Thy-1 Cell Surface Antigen (THY1, Accession

NM_006288), a gene which plays a role in cell-cell or cell-ligand interactions during synaptogenesis. Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THY1. The function of THY1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM396.Calneuron 1 (CALN1, Accession NM_031468) is another VGAM2623 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25522, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88398] Another function of VGAM2623 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Cell Division Cycle Associated 4 (CDCA4, Ac-

cession NM_017955) is another VGAM2623 host target gene. CDCA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDCA4 BINDING SITE, designated SEQ ID:19660, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88399] Another function of VGAM2623 is therefore inhibition of Cell Division Cycle Associated 4 (CDCA4, Accession NM_017955). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDCA4. Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM_033043) is another VGAM2623 host target gene. CGB5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB5 BINDING SITE, designated SEQ ID:26930,

to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88400] Another function of VGAM2623 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM_033043). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB5. Chorionic Gonadotropin, Beta Polypeptide 7 (CGB7, Accession NM_033142) is another VGAM2623 host target gene. CGB7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB7 BINDING SITE, designated SEQ ID:26994, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88401] Another function of VGAM2623 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 7 (CGB7, Accession NM_033142). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB7. Chorionic Gonadotropin, Beta Polypeptide 8 (CGB8, Accession

NM_033183) is another VGAM2623 host target gene. CGB8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB8 BINDING SITE, designated SEQ ID:27045, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88402] Another function of VGAM2623 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 8 (CGB8, Accession NM_033183). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB8. DKFZp762E1312 (Accession NM_018410) is another VGAM2623 host target gene. DKFZp762E1312 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp762E1312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:20450, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM

RNA, also designated SEQ ID:5334.

[88403] Another function of VGAM2623 is therefore inhibition of DKFZp762E1312 (Accession NM_018410). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1312. FLJ12783 (Accession NM_031426) is another VGAM2623 host target gene. FLJ12783 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:25417, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88404] Another function of VGAM2623 is therefore inhibition of FLJ12783 (Accession NM_031426). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783. FLJ14437 (Accession NM_032578) is another VGAM2623 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14437, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26308, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88405] Another function of VGAM2623 is therefore inhibition of FLJ14437 (Accession NM_032578). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. FLJ14810 (Accession NM_032843) is another VGAM2623 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26634, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88406] Another function of VGAM2623 is therefore inhibition of FLJ14810 (Accession NM_032843). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14810. FLJ20174 (Accession NM_017699) is another VGAM2623 host target gene. FLJ20174 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:19268, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88407] Another function of VGAM2623 is therefore inhibition of FLJ20174 (Accession NM_017699). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20174. KIAA0449 (Accession NM_017596) is another VGAM2623 host target gene. KIAA0449 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19051, to the

nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88408] Another function of VGAM2623 is therefore inhibition of KIAA0449 (Accession NM_017596). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0449. KIAA0545 (Accession XM_032278) is another VGAM2623 host target gene. KIAA0545 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0545 BINDING SITE, designated SEQ ID:31635, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88409] Another function of VGAM2623 is therefore inhibition of KIAA0545 (Accession XM_032278). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0545. KIAA1010 (Accession XM_050742) is another VGAM2623 host target gene. KIAA1010 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1010 BINDING SITE, designated SEQ ID:35670, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88410] Another function of VGAM2623 is therefore inhibition of KIAA1010 (Accession XM_050742). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1010. KIAA1089 (Accession XM_044148) is another VGAM2623 host target gene. KIAA1089 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1089 BINDING SITE, designated SEQ ID:34140, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88411] Another function of VGAM2623 is therefore inhibition of KIAA1089 (Accession XM_044148). Accordingly, utilities

of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1089. KIAA1110 (Accession XM_029973) is another VGAM2623 host target gene. KIAA1110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:30984, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88412] Another function of VGAM2623 is therefore inhibition of KIAA1110 (Accession XM_029973). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110. KIAA1272 (Accession XM_046600) is another VGAM2623 host target gene. KIAA1272 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1272 BINDING SITE, designated SEQ ID:34761, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88413] Another function of VGAM2623 is therefore inhibition of KIAA1272 (Accession XM_046600). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1272. KIAA1855 (Accession XM_166453) is another VGAM2623 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44356, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88414] Another function of VGAM2623 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. MGC16279 (Accession XM_031808) is another VGAM2623 host target gene. MGC16279 BINDING SITE1

and MGC16279 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC16279, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16279 BINDING SITE1 and MGC16279 BINDING SITE2, designated SEQ ID:31488 and SEQ ID:26734 respectively, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88415] Another function of VGAM2623 is therefore inhibition of MGC16279 (Accession XM_031808). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16279. Myosin XVIIIB (MYO18B, Accession NM_032608) is another VGAM2623 host target gene. MYO18B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYO18B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO18B BINDING SITE, designated SEQ ID:26331, to the nucleotide sequence of VGAM2623 RNA,

herein designated VGAM RNA, also designated SEQ ID:5334.

[88416] Another function of VGAM2623 is therefore inhibition of Myosin XVIIIB (MYO18B, Accession NM_032608). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO18B. PGS1 (Accession NM_024419) is another VGAM2623 host target gene. PGS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PGS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGS1 BINDING SITE, designated SEQ ID:23657, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88417] Another function of VGAM2623 is therefore inhibition of PGS1 (Accession NM_024419). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGS1. Ring Finger Protein 36 (RNF36, Accession NM_080745) is another VGAM2623 host target gene. RNF36 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by RNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF36 BINDING SITE, designated SEQ ID:28032, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88418] Another function of VGAM2623 is therefore inhibition of Ring Finger Protein 36 (RNF36, Accession NM_080745). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF36. Transmembrane 4 Superfamily Member 11 (plasmolipin) (TM4SF11, Accession NM_015993) is another VGAM2623 host target gene. TM4SF11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TM4SF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF11 BINDING SITE, designated SEQ ID:18084, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88419] Another function of VGAM2623 is therefore inhibition of Transmembrane 4 Superfamily Member 11 (plasmolipin) (TM4SF11, Accession NM_015993). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF11. LOC115129 (Accession XM_055292) is another VGAM2623 host target gene. LOC115129 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36252, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88420] Another function of VGAM2623 is therefore inhibition of LOC115129 (Accession XM_055292). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC144114 (Accession XM_090198) is another VGAM2623 host target gene. LOC144114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144114, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144114 BINDING SITE, designated SEQ ID:39993, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88421] Another function of VGAM2623 is therefore inhibition of LOC144114 (Accession XM_090198). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144114. LOC146184 (Accession XM_096942) is another VGAM2623 host target gene. LOC146184 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146184 BINDING SITE, designated SEQ ID:40661, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88422] Another function of VGAM2623 is therefore inhibition of LOC146184 (Accession XM_096942). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146184. LOC158156 (Accession XM_088496) is another VGAM2623 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39740, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88423] Another function of VGAM2623 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. LOC196483 (Accession XM_016909) is another VGAM2623 host target gene. LOC196483 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196483 BINDING SITE, designated SEQ ID:30291, to

the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88424] Another function of VGAM2623 is therefore inhibition of LOC196483 (Accession XM_016909). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196483. LOC196955 (Accession XM_085210) is another VGAM2623 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37933, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88425] Another function of VGAM2623 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC204970 (Accession XM_114795) is another VGAM2623 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43068, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88426] Another function of VGAM2623 is therefore inhibition of LOC204970 (Accession XM_114795). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC220739 (Accession XM_167548) is another VGAM2623 host target gene. LOC220739 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:44656, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88427] Another function of VGAM2623 is therefore inhibition of LOC220739 (Accession XM_167548). Accordingly, utilities

of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739. LOC221466 (Accession XM_168087) is another VGAM2623 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44992, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88428] Another function of VGAM2623 is therefore inhibition of LOC221466 (Accession XM_168087). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC255974 (Accession XM_173706) is another VGAM2623 host target gene. LOC255974 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255974 BINDING SITE, designated SEQ ID:46556, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88429] Another function of VGAM2623 is therefore inhibition of LOC255974 (Accession XM_173706). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255974. LOC51337 (Accession NM_016647) is another VGAM2623 host target gene. LOC51337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51337 BINDING SITE, designated SEQ ID:18762, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88430] Another function of VGAM2623 is therefore inhibition of LOC51337 (Accession NM_016647). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51337. LOC90092 (Accession XM_028862) is another VGAM2623 host target gene. LOC90092 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30786, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88431] Another function of VGAM2623 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. LOC96652 (Accession XM_037474) is another VGAM2623 host target gene. LOC96652 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC96652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96652 BINDING SITE, designated SEQ ID:32628, to the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, also designated SEQ ID:5334.

[88432] Another function of VGAM2623 is therefore inhibition of

LOC96652 (Accession XM_037474). Accordingly, utilities of VGAM2623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96652. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2624 (VGAM2624) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88433] VGAM2624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2624 was detected is described hereinabove with reference to Figs. 1-8.

[88434] VGAM2624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 Plaque Virus. VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88435] VGAM2624 gene encodes a VGAM2624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2624 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2624 precursor RNA is designated SEQ ID:2610, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2610 is located at position 5482 relative to the genome of A-2 Plaque Virus.

[88436] VGAM2624 precursor RNA folds onto itself, forming VGAM2624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88437] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2624 folded precursor RNA into VGAM2624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM2624 RNA is designated SEQ ID:5335, and is provided hereinbelow with reference to the sequence listing part.

[88438] VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2624 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88439] VGAM2624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2624 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88440] The complementary binding of VGAM2624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2624 host target RNA into VGAM2624 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88441] It is appreciated that VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2624 host target genes. The mRNA of each one of this plurality of VGAM2624 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2624 RNA, herein designated VGAM RNA, and which when bound by VGAM2624 RNA causes inhibition of translation of respective one or more VGAM2624 host target proteins.

[88442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2624 gene, herein designated VGAM GENE, on one or more VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88443] It is yet further appreciated that a function of VGAM2624

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2624 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific functions, and accordingly utilities, of VGAM2624 correlate with, and may be deduced from, the identity of the host target genes which VGAM2624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88444] Nucleotide sequences of the VGAM2624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2624 are further described hereinbelow with reference to Table 1.

[88445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2624 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88446] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2624 gene, herein designated VGAM is inhibition of expression of VGAM2624 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2624 correlate with, and may be deduced from, the identity of the target genes which VGAM2624 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88447] Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350) is a VGAM2624 host target gene. PDGFRB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB BINDING SITE, designated SEQ ID:32818, to the nucleotide sequence of VGAM2624 RNA, herein designated VGAM RNA, also designated SEQ ID:5335.

[88448] A function of VGAM2624 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase

receptor. Accordingly, utilities of VGAM2624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Ras Association (RalGDS/AF-6) Domain Family 1 (RASSF1, Accession NM_007182) is another VGAM2624 host target gene. RASSF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF1 BINDING SITE, designated SEQ ID:14039, to the nucleotide sequence of VGAM2624 RNA, herein designated VGAM RNA, also designated SEQ ID:5335.

[88449] Another function of VGAM2624 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 1 (RASSF1, Accession NM_007182), a gene which is a candidate renal tumor suppressor. Accordingly, utilities of VGAM2624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF1. The function of

RASSF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.LOC157681 (Accession XM_088363) is another VGAM2624 host target gene. LOC157681 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157681 BINDING SITE, designated SEQ ID:39642, to the nucleotide sequence of VGAM2624 RNA, herein designated VGAM RNA, also designated SEQ ID:5335.

[88450] Another function of VGAM2624 is therefore inhibition of LOC157681 (Accession XM_088363). Accordingly, utilities of VGAM2624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157681. LOC221431 (Accession XM_166380) is another VGAM2624 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44225, to the nucleotide sequence of VGAM2624 RNA, herein designated VGAM RNA, also designated SEQ ID:5335.

[88451] Another function of VGAM2624 is therefore inhibition of LOC221431 (Accession XM_166380). Accordingly, utilities of VGAM2624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2625 (VGAM2625) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88452] VGAM2625 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2625 was detected is described hereinabove with reference to Figs. 1-8.

[88453] VGAM2625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 Plaque Virus. VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[88454] VGAM2625 gene encodes a VGAM2625 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2625 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2625 precursor RNA is designated SEQ ID:2611, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2611 is located at position 6077 relative to the genome of A-2 Plaque Virus.

[88455] VGAM2625 precursor RNA folds onto itself, forming VGAM2625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88456] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2625 folded precursor RNA into VGAM2625 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2625 RNA is designated SEQ ID:5336, and is provided hereinbelow with reference to the sequence listing part.

[88457] VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2625 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88458] VGAM2625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2625 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88459] The complementary binding of VGAM2625 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2625 host target RNA into VGAM2625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88460] It is appreciated that VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2625 host target genes. The mRNA of each one of this plurality of VGAM2625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2625 RNA, herein designated VGAM RNA, and which when bound by VGAM2625 RNA causes inhibition of translation of respective one or more VGAM2625 host target proteins.

[88461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2625 gene, herein designated VGAM GENE, on one or more VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88462] It is yet further appreciated that a function of VGAM2625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2625 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific functions, and accordingly utilities, of VGAM2625 correlate with, and may be deduced from, the identity of the host target genes which VGAM2625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88463] Nucleotide sequences of the VGAM2625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2625 are further described hereinbelow with reference to Table 1.

[88464] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2625 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88465] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2625 gene, herein designated VGAM is inhibition of expression of VGAM2625 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2625 correlate with, and may be deduced from, the identity of the target genes which VGAM2625 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88466] Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM_002235) is a VGAM2625 host target gene. KCNA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:8015, to the nucleotide sequence of VGAM2625 RNA, herein designated VGAM RNA,

also designated SEQ ID:5336.

[88467] A function of VGAM2625 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM_002235), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM2625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA6. The function of KCNA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM893.LOC161823 (Accession XM_091156) is another VGAM2625 host target gene. LOC161823 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161823 BINDING SITE, designated SEQ ID:40030, to the nucleotide sequence of VGAM2625 RNA, herein designated VGAM RNA, also designated SEQ ID:5336.

[88468] Another function of VGAM2625 is therefore inhibition of LOC161823 (Accession XM_091156). Accordingly, utilities

of VGAM2625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161823. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2626 (VGAM2626) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88469] VGAM2626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2626 was detected is described hereinabove with reference to Figs. 1-8.

[88470] VGAM2626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Encephalomyelitis Virus. VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88471] VGAM2626 gene encodes a VGAM2626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2626 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2626 precursor RNA is designated SEQ ID:2612, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2612 is located at position 6595 relative to the genome of Avian Encephalomyelitis Virus.

[88472] VGAM2626 precursor RNA folds onto itself, forming VGAM2626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88473] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2626 folded precursor RNA into VGAM2626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2626 RNA is designated SEQ ID:5337, and

is provided hereinbelow with reference to the sequence listing part.

[88474] VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2626 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88475] VGAM2626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2626 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88476] The complementary binding of VGAM2626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2626 host target RNA into VGAM2626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88477] It is appreciated that VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2626 host target genes. The mRNA of each one of this plurality of VGAM2626 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2626 RNA, herein designated VGAM RNA, and which when bound by VGAM2626 RNA causes inhibition of translation of respective one or more VGAM2626 host target proteins.

[88478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2626 gene, herein designated VGAM GENE, on one or more VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88479] It is yet further appreciated that a function of VGAM2626 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of viral infection by Avian Encephalomyelitis Virus. Specific functions, and accordingly utilities, of VGAM2626 correlate with, and may be deduced from, the identity of the host target genes which VGAM2626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88480] Nucleotide sequences of the VGAM2626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2626 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2626 are further described hereinbelow with reference to Table 1.

[88481] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2626 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88482] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2626 gene, herein designated VGAM is inhibition of expression of VGAM2626 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2626 correlate with, and may be deduced from, the identity of the target genes which VGAM2626 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88483] Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM_043106) is a VGAM2626 host target gene. KCNS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:33899, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88484] A function of VGAM2626 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM_043106), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utili-

ties of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS2. The function of KCNS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM_003307) is another VGAM2626 host target gene. TRPM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM2 BINDING SITE, designated SEQ ID:9311, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88485] Another function of VGAM2626 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM_003307), a gene which may be a calcium channel. Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM2.

The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928.DKFZp434A1010 (Accession XM_049185) is another VGAM2626 host target gene. DKFZp434A1010 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DK-FZp434A1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A1010 BINDING SITE, designated SEQ ID:35345, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88486] Another function of VGAM2626 is therefore inhibition of DKFZp434A1010 (Accession XM_049185). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A1010. FLJ11383 (Accession NM_024938) is another VGAM2626 host target gene. FLJ11383 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11383, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11383 BINDING SITE, designated SEQ ID:24480, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88487] Another function of VGAM2626 is therefore inhibition of FLJ11383 (Accession NM_024938). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11383. FLJ13102 (Accession NM_024887) is another VGAM2626 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:24341, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88488] Another function of VGAM2626 is therefore inhibition of FLJ13102 (Accession NM_024887). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13102. KIAA0286 (Accession XM_043118) is another VGAM2626 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33906, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88489] Another function of VGAM2626 is therefore inhibition of KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0737 (Accession NM_014828) is another VGAM2626 host target gene. KIAA0737 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0737 BINDING SITE, designated SEQ ID:16819, to the nucleotide sequence of VGAM2626 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5337.

[88490] Another function of VGAM2626 is therefore inhibition of KIAA0737 (Accession NM_014828). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0737. MGC3020 (Accession NM_024048) is another VGAM2626 host target gene. MGC3020 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3020 BINDING SITE, designated SEQ ID:23482, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88491] Another function of VGAM2626 is therefore inhibition of MGC3020 (Accession NM_024048). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3020. Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463) is another VGAM2626 host target gene. PTP4A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PTP4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A1 BINDING SITE, designated SEQ ID:9532, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88492] Another function of VGAM2626 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A1. LOC144519 (Accession XM_084890) is another VGAM2626 host target gene. LOC144519 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37758, to the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, also designated SEQ ID:5337.

[88493] Another function of VGAM2626 is therefore inhibition of

LOC144519 (Accession XM_084890). Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2627 (VGAM2627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88494] VGAM2627 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2627 was detected is described hereinabove with reference to Figs. 1-8.

[88495] VGAM2627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Encephalomyelitis Virus. VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88496] VGAM2627 gene encodes a VGAM2627 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2627 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2627 precursor RNA is designated SEQ ID:2613, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2613 is located at position 5436 relative to the genome of Avian Encephalomyelitis Virus.

[88497] VGAM2627 precursor RNA folds onto itself, forming VGAM2627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88498] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2627 folded precursor RNA into VGAM2627 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide se-

quence of VGAM2627 RNA is designated SEQ ID:5338, and is provided hereinbelow with reference to the sequence listing part.

[88499] VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2627 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88500] VGAM2627 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2627 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2627 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88501] The complementary binding of VGAM2627 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2627 host target RNA into VGAM2627 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88502] It is appreciated that VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2627 host target genes. The mRNA of each one of this plurality of VGAM2627 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2627 RNA, herein designated VGAM RNA, and which when bound by VGAM2627 RNA causes inhibition of translation of respective one or more VGAM2627 host target proteins.

[88503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2627 gene, herein designated VGAM GENE, on one or more VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88504] It is yet further appreciated that a function of VGAM2627

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of viral infection by Avian Encephalomyelitis Virus. Specific functions, and accordingly utilities, of VGAM2627 correlate with, and may be deduced from, the identity of the host target genes which VGAM2627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88505] Nucleotide sequences of the VGAM2627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2627 are further described hereinbelow with reference to Table 1.

[88506] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2627 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88507] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2627 gene, herein designated VGAM is inhibition of expression of VGAM2627 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2627 correlate with, and may be deduced from, the identity of the target genes which VGAM2627 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88508] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM2627 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23166, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88509] A function of VGAM2627 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with BCL11B. Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM_004382) is another VGAM2627 host target gene. CRHR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRHR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR1 BINDING SITE, designated SEQ ID:10604, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88510] Another function of VGAM2627 is therefore inhibition of Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM_004382), a gene which likely mediates physiological and behavioral response to stress. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR1. The function of CRHR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435.Enoyl-Coenzyme A, Hydratase/3-hydroxyacyl Coenzyme A Dehydrogenase

(EHHADH, Accession NM_001966) is another VGAM2627 host target gene. EHHADH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EHHADH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHHADH BINDING SITE, designated SEQ ID:7694, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88511] Another function of VGAM2627 is therefore inhibition of Enoyl-Coenzyme A, Hydratase/3-hydroxyacyl Coenzyme A Dehydrogenase (EHHADH, Accession NM_001966), a gene which functions in the peroxisomal beta-oxidation pathway. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHHADH. The function of EHHADH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300) is another VGAM2627 host target gene. FBXW1B BINDING SITE1 through FBXW1B

BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:14663, SEQ ID:27365 and SEQ ID:27375 respectively, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88512] Another function of VGAM2627 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300), a gene which somehow is involved in the process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM2627 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in

the 5` untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22023, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88513] Another function of VGAM2627 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Phosphorylase Kinase, Alpha 2 (liver) (PHKA2, Accession NM_000292) is another VGAM2627 host target gene. PHKA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHKA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PHKA2 BINDING SITE, designated SEQ ID:5834, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88514] Another function of VGAM2627 is therefore inhibition of Phosphorylase Kinase, Alpha 2 (liver) (PHKA2, Accession NM_000292). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHKA2. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848) is another VGAM2627 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:8741, SEQ ID:25034, SEQ ID:25006, SEQ ID:25014 and SEQ ID:25023 respectively, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88515] Another function of VGAM2627 is therefore inhibition of

Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140.Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM_003270) is another VGAM2627 host target gene. TM4SF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TM4SF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF6 BINDING SITE, designated SEQ ID:9285, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88516] Another function of VGAM2627 is therefore inhibition of Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM_003270), a gene which plays a role in the

regulation of cell development, activation, growth and motility. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF6. The function of TM4SF6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM84.DKFZP564K0822 (Accession XM_168378) is another VGAM2627 host target gene. DKFZP564K0822 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K0822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564K0822 BINDING SITE, designated SEQ ID:45139, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88517] Another function of VGAM2627 is therefore inhibition of DKFZP564K0822 (Accession XM_168378). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K0822. FLJ10856 (Accession NM_018247)

is another VGAM2627 host target gene. FLJ10856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10856 BINDING SITE, designated SEQ ID:20217, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88518] Another function of VGAM2627 is therefore inhibition of FLJ10856 (Accession NM_018247). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10856. KIAA0087 (Accession NM_014769) is another VGAM2627 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16559, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88519] Another function of VGAM2627 is therefore inhibition of KIAA0087 (Accession NM_014769). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA0461 (Accession XM_047883) is another VGAM2627 host target gene. KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35070, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88520] Another function of VGAM2627 is therefore inhibition of KIAA0461 (Accession XM_047883). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. KIAA1319 (Accession NM_020770) is another VGAM2627 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21868, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88521] Another function of VGAM2627 is therefore inhibition of KIAA1319 (Accession NM_020770). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. KIAA1954 (Accession XM_085375) is another VGAM2627 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38092, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88522] Another function of VGAM2627 is therefore inhibition of KIAA1954 (Accession XM_085375). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1954. Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM_130842) is another VGAM2627 host target gene. PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2, designated SEQ ID:28369 and SEQ ID:28374 respectively, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88523] Another function of VGAM2627 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM_130842). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2. SCAMP5 (Accession NM_138967) is another VGAM2627 host target gene. SCAMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE, designated SEQ ID:29071, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88524] Another function of VGAM2627 is therefore inhibition of SCAMP5 (Accession NM_138967). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5. ZNF-U69274 (Accession NM_014415) is another VGAM2627 host target gene. ZNF-U69274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF-U69274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF-U69274 BINDING SITE, designated SEQ ID:15760, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88525] Another function of VGAM2627 is therefore inhibition of ZNF-U69274 (Accession NM_014415). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ZNF-U69274. Zinc Finger Protein 304 (ZNF304, Accession NM_020657) is another VGAM2627 host target gene. ZNF304 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF304 BINDING SITE, designated SEQ ID:21830, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88526] Another function of VGAM2627 is therefore inhibition of Zinc Finger Protein 304 (ZNF304, Accession NM_020657). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF304. LOC120856 (Accession XM_058509) is another VGAM2627 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, desig-

nated SEQ ID:36639, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88527] Another function of VGAM2627 is therefore inhibition of LOC120856 (Accession XM_058509). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC128844 (Accession XM_066199) is another VGAM2627 host target gene. LOC128844 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC128844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128844 BINDING SITE, designated SEQ ID:37319, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88528] Another function of VGAM2627 is therefore inhibition of LOC128844 (Accession XM_066199). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128844. LOC161734 (Accession XM_102109) is another VGAM2627 host target gene. LOC161734 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161734 BINDING SITE, designated SEQ ID:42109, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88529] Another function of VGAM2627 is therefore inhibition of LOC161734 (Accession XM_102109). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161734. LOC219445 (Accession XM_166212) is another VGAM2627 host target gene. LOC219445 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219445 BINDING SITE, designated SEQ ID:44012, to the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, also designated SEQ ID:5338.

[88530] Another function of VGAM2627 is therefore inhibition of

LOC219445 (Accession XM_166212). Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2628 (VGAM2628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88531] VGAM2628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2628 was detected is described hereinabove with reference to Figs. 1-8.

[88532] VGAM2628 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Encephalomyelitis Virus. VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88533] VGAM2628 gene encodes a VGAM2628 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2628 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2628 precursor RNA is designated SEQ ID:2614, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2614 is located at position 4961 relative to the genome of Avian Encephalomyelitis Virus.

[88534] VGAM2628 precursor RNA folds onto itself, forming VGAM2628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88535] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2628 folded precursor RNA into VGAM2628 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2628 RNA is designated SEQ ID:5339, and is provided hereinbelow with reference to the sequence listing part.

[88536] VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2628 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88537] VGAM2628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2628 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2628 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88538] The complementary binding of VGAM2628 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2628 host target RNA into VGAM2628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88539] It is appreciated that VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2628 host target genes. The mRNA of each one of this plurality of VGAM2628 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2628 RNA, herein designated VGAM RNA, and which when bound by VGAM2628 RNA causes inhibition of translation of respective one or more VGAM2628 host target proteins.

[88540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2628 gene, herein designated VGAM GENE, on one or more VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88541] It is yet further appreciated that a function of VGAM2628

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of viral infection by Avian Encephalomyelitis Virus. Specific functions, and accordingly utilities, of VGAM2628 correlate with, and may be deduced from, the identity of the host target genes which VGAM2628 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88542] Nucleotide sequences of the VGAM2628 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2628 are further described hereinbelow with reference to Table 1.

[88543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2628 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88544] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2628 gene, herein designated VGAM is inhibition of expression of VGAM2628 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2628 correlate with, and may be deduced from, the identity of the target genes which VGAM2628 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88545] Amiloride Binding Protein 1 (amine oxidase (copper-containing)) (ABP1, Accession XM_032220) is a VGAM2628 host target gene. ABP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABP1 BINDING SITE, designated SEQ ID:31614, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88546] A function of VGAM2628 is therefore inhibition of Amiloride Binding Protein 1 (amine oxidase (copper-containing)) (ABP1, Accession XM_032220), a gene which catalyzes the degradation of compounds such

as putrescine. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABP1. The function of ABP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203) is another VGAM2628 host target gene. AKAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14059, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88547] Another function of VGAM2628 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2.

The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Centrin, EF-hand Protein, 1 (CETN1, Accession XM_170866) is another VGAM2628 host target gene. CETN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CETN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CETN1 BINDING SITE, designated SEQ ID:45638, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88548] Another function of VGAM2628 is therefore inhibition of Centrin, EF-hand Protein, 1 (CETN1, Accession XM_170866). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CETN1. Erythrocyte Membrane Protein Band 4.1 (elliptocytosis 1, RH-linked) (EPB41, Accession NM_004437) is another VGAM2628 host target gene. EPB41 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by EPB41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41 BINDING SITE, designated SEQ ID:10721, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88549] Another function of VGAM2628 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1 (elliptocytosis 1, RH-linked) (EPB41, Accession NM_004437), a gene which protein 4.1 is a major structural element of the erythrocyte membrane skeleton. it plays a key role in regulating membrane physical properties of mechanical stability and deformability by stabilizing spectrin-actin interaction. binds with a high affinity to glycophorin and with lower affinity to band iii protein. associates with the nuclear mitotic apparatus. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41. The function of EPB41 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1709.Follistatin-like 1 (FSTL1, Accession

NM_007085) is another VGAM2628 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13948, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88550] Another function of VGAM2628 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM_000841) is another VGAM2628 host target gene. GRM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRM4, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM4 BINDING SITE, designated SEQ ID:6502, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88551] Another function of VGAM2628 is therefore inhibition of Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM_000841), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM4. The function of GRM4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052.Methyltransferase-like 1 (METTL1, Accession NM_023032) is another VGAM2628 host target gene. METTL1 BINDING SITE1 and METTL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by METTL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

METTL1 BINDING SITE1 and METTL1 BINDING SITE2, designated SEQ ID:23305 and SEQ ID:23310 respectively, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88552] Another function of VGAM2628 is therefore inhibition of Methyltransferase-like 1 (METTL1, Accession NM_023032). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with METTL1. Neuroligin 1 (NLGN1, Accession NM_014932) is another VGAM2628 host target gene. NLGN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NLGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:17229, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88553] Another function of VGAM2628 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM_014932), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of VGAM2628 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with NLGN1. The function of NLGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659.5'-nucleotidase, Cytosolic II (NT5C2, Accession NM_012229) is another VGAM2628 host target gene. NT5C2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NT5C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5C2 BINDING SITE, designated SEQ ID:14526, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88554] Another function of VGAM2628 is therefore inhibition of 5'-nucleotidase, Cytosolic II (NT5C2, Accession NM_012229). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C2. Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594) is another VGAM2628 host target gene.

PCSK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK2 BINDING SITE, designated SEQ ID:8453, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88555] Another function of VGAM2628 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594), a gene which is involved in the processing of hormone and other protein precursors at sites comprised of pairs of basic amino acid residues. Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK2. The function of PCSK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1120.BHC80 (Accession NM_016621) is another VGAM2628 host target gene. BHC80 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BHC80, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHC80 BINDING SITE, designated SEQ ID:18728, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88556] Another function of VGAM2628 is therefore inhibition of BHC80 (Accession NM_016621). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHC80. Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715) is another VGAM2628 host target gene. BIRC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC3 BINDING SITE, designated SEQ ID:33368, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88557] Another function of VGAM2628 is therefore inhibition of Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715). Accordingly, utilities of VGAM2628 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC3. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331) is another VGAM2628 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23629, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88558] Another function of VGAM2628 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. CASPR3 (Accession NM_033655) is another VGAM2628 host target gene. CASPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASPR3 BINDING SITE, designated SEQ ID:27385, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88559] Another function of VGAM2628 is therefore inhibition of CASPR3 (Accession NM_033655). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR3. Calsyntenin 2 (CLSTN2, Accession NM_022131) is another VGAM2628 host target gene. CLSTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLSTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN2 BINDING SITE, designated SEQ ID:22691, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88560] Another function of VGAM2628 is therefore inhibition of Calsyntenin 2 (CLSTN2, Accession NM_022131). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with CLSTN2. CRIPT (Accession XM_057669) is another VGAM2628 host target gene. CRIPT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRIPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIPT BINDING SITE, designated SEQ ID:36537, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88561] Another function of VGAM2628 is therefore inhibition of CRIPT (Accession XM_057669). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIPT. DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787) is another VGAM2628 host target gene. DNAJC6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC6 BINDING SITE, designated SEQ ID:16657, to the nucleotide sequence of VGAM2628 RNA,

herein designated VGAM RNA, also designated SEQ ID:5339.

[88562] Another function of VGAM2628 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC6. FLJ10392 (Accession NM_018084) is another VGAM2628 host target gene. FLJ10392 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10392 BINDING SITE, designated SEQ ID:19845, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88563] Another function of VGAM2628 is therefore inhibition of FLJ10392 (Accession NM_018084). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10392. FLJ20552 (Accession NM_017876) is another VGAM2628 host target gene. FLJ20552 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20552 BINDING SITE, designated SEQ ID:19547, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88564] Another function of VGAM2628 is therefore inhibition of FLJ20552 (Accession NM_017876). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20552. FLJ21195 (Accession NM_022469) is another VGAM2628 host target gene. FLJ21195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21195 BINDING SITE, designated SEQ ID:22823, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88565] Another function of VGAM2628 is therefore inhibition of

FLJ21195 (Accession NM_022469). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21195. KIAA1950 (Accession XM_166532) is another VGAM2628 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44485, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88566] Another function of VGAM2628 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. KR18 (Accession NM_033288) is another VGAM2628 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27115, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88567] Another function of VGAM2628 is therefore inhibition of KR18 (Accession NM_033288). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. Lysosomal-associated Membrane Protein 3 (LAMP3, Accession XM_003022) is another VGAM2628 host target gene. LAMP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP3 BINDING SITE, designated SEQ ID:29915, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88568] Another function of VGAM2628 is therefore inhibition of Lysosomal-associated Membrane Protein 3 (LAMP3, Accession XM_003022). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LAMP3. RER1 (Accession NM_007033) is another VGAM2628 host target gene. RER1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RER1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RER1 BINDING SITE, designated SEQ ID:13902, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88569] Another function of VGAM2628 is therefore inhibition of RER1 (Accession NM_007033). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RER1. SCYA28 (Accession NM_019846) is another VGAM2628 host target gene. SCYA28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYA28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA28 BINDING SITE, designated SEQ ID:21249, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5339.

[88570] Another function of VGAM2628 is therefore inhibition of SCYA28 (Accession NM_019846). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA28. Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM_013233) is another VGAM2628 host target gene. STK39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK39 BINDING SITE, designated SEQ ID:14892, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88571] Another function of VGAM2628 is therefore inhibition of Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM_013233). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK39. Tyrosine Kinase, Non-receptor, 1 (TNK1, Accession NM_003985) is another VGAM2628 host target gene.

TNK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNK1 BINDING SITE, designated SEQ ID:10134, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88572] Another function of VGAM2628 is therefore inhibition of Tyrosine Kinase, Non-receptor, 1 (TNK1, Accession NM_003985). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNK1. LOC132880 (Accession XM_059609) is another VGAM2628 host target gene. LOC132880 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132880 BINDING SITE, designated SEQ ID:37029, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88573] Another function of VGAM2628 is therefore inhibition of LOC132880 (Accession XM_059609). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132880. LOC147138 (Accession XM_085717) is another VGAM2628 host target gene. LOC147138 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147138 BINDING SITE, designated SEQ ID:38307, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88574] Another function of VGAM2628 is therefore inhibition of LOC147138 (Accession XM_085717). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147138. LOC147727 (Accession XM_085862) is another VGAM2628 host target gene. LOC147727 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147727, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147727 BINDING SITE, designated SEQ ID:38380, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88575] Another function of VGAM2628 is therefore inhibition of LOC147727 (Accession XM_085862). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147727. LOC155081 (Accession XM_088145) is another VGAM2628 host target gene. LOC155081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155081 BINDING SITE, designated SEQ ID:39542, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88576] Another function of VGAM2628 is therefore inhibition of LOC155081 (Accession XM_088145). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC155081. LOC201245 (Accession XM_113326) is another VGAM2628 host target gene. LOC201245 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201245 BINDING SITE, designated SEQ ID:42228, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88577] Another function of VGAM2628 is therefore inhibition of LOC201245 (Accession XM_113326). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201245. LOC202802 (Accession XM_114560) is another VGAM2628 host target gene. LOC202802 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202802 BINDING SITE, designated SEQ ID:42987, to the nucleotide sequence of VGAM2628 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5339.

[88578] Another function of VGAM2628 is therefore inhibition of LOC202802 (Accession XM_114560). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202802. LOC222228 (Accession XM_168627) is another VGAM2628 host target gene. LOC222228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222228 BINDING SITE, designated SEQ ID:45273, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88579] Another function of VGAM2628 is therefore inhibition of LOC222228 (Accession XM_168627). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222228. LOC222233 (Accession XM_168560) is another VGAM2628 host target gene. LOC222233 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222233, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222233 BINDING SITE, designated SEQ ID:45242, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88580] Another function of VGAM2628 is therefore inhibition of LOC222233 (Accession XM_168560). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222233. LOC57406 (Accession NM_020676) is another VGAM2628 host target gene. LOC57406 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57406, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57406 BINDING SITE, designated SEQ ID:21837, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88581] Another function of VGAM2628 is therefore inhibition of LOC57406 (Accession NM_020676). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC57406. LOC92568 (Accession XM_045852) is another VGAM2628 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34575, to the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, also designated SEQ ID:5339.

[88582] Another function of VGAM2628 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM2628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2629 (VGAM2629) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88583] VGAM2629 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2629 was detected is described hereinabove with reference to Figs. 1-8.

[88584] VGAM2629 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Encephalomyelitis Virus. VGAM2629 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88585] VGAM2629 gene encodes a VGAM2629 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2629 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2629 precursor RNA is designated SEQ ID:2615, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2615 is located at position 2698 relative to the genome of Avian Encephalomyelitis Virus.

[88586] VGAM2629 precursor RNA folds onto itself, forming VGAM2629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88587] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2629 folded precursor RNA into VGAM2629 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2629 RNA is designated SEQ ID:5340, and is provided hereinbelow with reference to the sequence listing part.

[88588] VGAM2629 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2629 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2629 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88589] VGAM2629 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2629 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2629 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2629 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2629 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88590] The complementary binding of VGAM2629 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2629 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2629 host target RNA into VGAM2629 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88591] It is appreciated that VGAM2629 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2629 host target genes. The mRNA of each one of this plurality of VGAM2629 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2629 RNA, herein designated VGAM RNA, and which when bound by VGAM2629 RNA causes inhibition of translation of respective one or more VGAM2629 host target proteins.

[88592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2629 gene, herein designated VGAM GENE, on one or more VGAM2629 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88593] It is yet further appreciated that a function of VGAM2629 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of viral infection by Avian Encephalomyelitis Virus. Specific functions, and accordingly utilities, of VGAM2629 correlate with, and may be deduced from, the identity of the host target genes which VGAM2629 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88594] Nucleotide sequences of the VGAM2629 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2629 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2629 are further described hereinbelow with reference to Table 1.

[88595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2629 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2629 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88596] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2629 gene, herein designated VGAM is inhibition of expression of VGAM2629 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2629 correlate with, and may be deduced from, the identity of the target genes which VGAM2629 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88597] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542) is a VGAM2629 host target gene. HGF BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45217, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88598] A function of VGAM2629 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174.Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM_000635) is another VGAM2629 host target gene. RFX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX2 BINDING SITE, designated SEQ ID:6269, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88599] Another function of VGAM2629 is therefore inhibition of Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM_000635), a gene which acts as a dimer to regulate the expression of many genes. Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX2. The function of RFX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM622.FLJ12934 (Accession NM_022899) is another VGAM2629 host target gene. FLJ12934 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12934 BINDING SITE, designated SEQ ID:23178, to the nucleotide sequence of VGAM2629 RNA,

herein designated VGAM RNA, also designated SEQ ID:5340.

[88600] Another function of VGAM2629 is therefore inhibition of FLJ12934 (Accession NM_022899). Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12934. FLJ13868 (Accession NM_022744) is another VGAM2629 host target gene. FLJ13868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13868 BINDING SITE, designated SEQ ID:22954, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88601] Another function of VGAM2629 is therefore inhibition of FLJ13868 (Accession NM_022744). Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13868. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM2629 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17425, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88602] Another function of VGAM2629 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. UPLC1 (Accession NM_017707) is another VGAM2629 host target gene. UPLC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UPLC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPLC1 BINDING SITE, designated SEQ ID:19283, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88603] Another function of VGAM2629 is therefore inhibition of UPLC1 (Accession NM_017707). Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPLC1. LOC149271 (Accession XM_086475) is another VGAM2629 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38674, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88604] Another function of VGAM2629 is therefore inhibition of LOC149271 (Accession XM_086475). Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC90333 (Accession XM_030958) is another VGAM2629 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31218, to the nucleotide sequence of VGAM2629 RNA, herein designated VGAM RNA, also designated SEQ ID:5340.

[88605] Another function of VGAM2629 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM2629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2630 (VGAM2630) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88606] VGAM2630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2630 was detected is described hereinabove with reference to Figs. 1-8.

[88607] VGAM2630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tamana Bat Virus. VGAM2630 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[88608] VGAM2630 gene encodes a VGAM2630 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2630 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2630 precursor RNA is designated SEQ ID:2616, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2616 is located at position 2276 relative to the genome of Tamana Bat Virus.

[88609] VGAM2630 precursor RNA folds onto itself, forming VGAM2630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88610] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2630 folded precursor RNA into VGAM2630

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2630 RNA is designated SEQ ID:5341, and is provided hereinbelow with reference to the sequence listing part.

[88611] VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2630 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88612] VGAM2630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2630 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88613] The complementary binding of VGAM2630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2630 host target RNA into VGAM2630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[88614] It is appreciated that VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2630 host target genes. The mRNA of each one of this plurality of VGAM2630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2630 RNA, herein designated VGAM RNA, and which when bound by VGAM2630 RNA causes inhibition of translation of respective one or more VGAM2630 host target proteins.

[88615] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2630 gene, herein designated VGAM GENE, on one or more VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88616] It is yet further appreciated that a function of VGAM2630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2630 include diagnosis, prevention and treatment of viral infection by Tamana Bat Virus. Specific functions, and accordingly utilities, of VGAM2630 correlate with, and may be deduced from, the identity of the host target genes which VGAM2630 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88617] Nucleotide sequences of the VGAM2630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2630 are further described hereinbelow with reference to Table 1.

[88618] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2630 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88619] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2630 gene, herein designated VGAM is inhibition of expression of VGAM2630 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2630 correlate with, and may be deduced from, the identity of the target genes which VGAM2630 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88620] General Transcription Factor IIH, Polypeptide 1, 62kDa (GTF2H1, Accession NM_005316) is a VGAM2630 host target gene. GTF2H1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTF2H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2H1 BINDING SITE, designated SEQ ID:11793, to the nucleotide sequence of

VGAM2630 RNA, herein designated VGAM RNA, also designated SEQ ID:5341.

[88621] A function of VGAM2630 is therefore inhibition of General Transcription Factor IIH, Polypeptide 1, 62kDa (GTF2H1, Accession NM_005316), a gene which is subunit of RNA polymerase II transcription initiation factor IIH; involved in transcription and DNA repair mechanisms. Accordingly, utilities of VGAM2630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2H1. The function of GTF2H1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1407.VAMP (vesicle-associated membrane protein)-associated Protein B and C (VAPB, Accession NM_004738) is another VGAM2630 host target gene. VAPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAPB BINDING SITE, designated SEQ ID:11133, to the nucleotide sequence of VGAM2630 RNA, herein designated VGAM RNA, also designated SEQ ID:5341.

[88622] Another function of VGAM2630 is therefore inhibition of VAMP (vesicle-associated membrane protein)-associated Protein B and C (VAPB, Accession NM_004738). Accordingly, utilities of VGAM2630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAPB. C1orf27 (Accession NM_017847) is another VGAM2630 host target gene. C1orf27 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C1orf27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf27 BINDING SITE, designated SEQ ID:19509, to the nucleotide sequence of VGAM2630 RNA, herein designated VGAM RNA, also designated SEQ ID:5341.

[88623] Another function of VGAM2630 is therefore inhibition of C1orf27 (Accession NM_017847). Accordingly, utilities of VGAM2630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf27. SRB7 Suppressor of RNA Polymerase B Homolog (yeast) (SURB7, Accession NM_004264) is another VGAM2630 host target gene. SURB7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SURB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURB7 BINDING SITE, designated SEQ ID:10465, to the nucleotide sequence of VGAM2630 RNA, herein designated VGAM RNA, also designated SEQ ID:5341.

[88624] Another function of VGAM2630 is therefore inhibition of SRB7 Suppressor of RNA Polymerase B Homolog (yeast) (SURB7, Accession NM_004264). Accordingly, utilities of VGAM2630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURB7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2631 (VGAM2631) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88625] VGAM2631 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2631 was detected is described hereinabove with reference to Figs. 1-8.

[88626] VGAM2631 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tamana Bat Virus. VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88627] VGAM2631 gene encodes a VGAM2631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2631 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2631 precursor RNA is designated SEQ ID:2617, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2617 is located at position 9727 relative to the genome of Tamana Bat Virus.

[88628] VGAM2631 precursor RNA folds onto itself, forming VGAM2631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88629] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2631 folded precursor RNA into VGAM2631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM2631 RNA is designated SEQ ID:5342, and is provided hereinbelow with reference to the sequence listing part.

[88630] VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2631 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88631] VGAM2631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2631 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88632] The complementary binding of VGAM2631 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2631

host target RNA into VGAM2631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88633] It is appreciated that VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2631 host target genes. The mRNA of each one of this plurality of VGAM2631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2631 RNA, herein designated VGAM RNA, and which when bound by VGAM2631 RNA causes inhibition of translation of respective one or more VGAM2631 host target proteins.

[88634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2631 gene, herein designated VGAM GENE, on one or more VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88635] It is yet further appreciated that a function of VGAM2631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of viral infection by Tamana Bat Virus. Specific functions, and accordingly utilities, of VGAM2631 correlate with, and may be deduced from, the identity of the host target genes which VGAM2631 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88636] Nucleotide sequences of the VGAM2631 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2631 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2631 are further

described hereinbelow with reference to Table 1.

[88637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2631 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88638] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2631 gene, herein designated VGAM is inhibition of expression of VGAM2631 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2631 correlate with, and may be deduced from, the identity of the target genes which VGAM2631 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88639] Adenylate Kinase 2 (AK2, Accession NM_013411) is a VGAM2631 host target gene. AK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK2 BINDING SITE, desig-

nated SEQ ID:15076, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88640] A function of VGAM2631 is therefore inhibition of Adenylate Kinase 2 (AK2, Accession NM_013411), a gene which essential for maintenance and cell growth. Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK2. The function of AK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1113.FKRP (Accession NM_024301) is another VGAM2631 host target gene. FKRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKRP BINDING SITE, designated SEQ ID:23591, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88641] Another function of VGAM2631 is therefore inhibition of FKRP (Accession NM_024301). Accordingly, utilities of

VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKRP. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3A (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NM_002711) is another VGAM2631 host target gene. PPP1R3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3A BINDING SITE, designated SEQ ID:8564, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88642] Another function of VGAM2631 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3A (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NM_002711), a gene which regulates phosphatase activity towards glycogen synthase, active in skeletal muscle. Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3A. The function of PPP1R3A and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1872.Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163) is another VGAM2631 host target gene. SLC14A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC14A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:14006, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88643] Another function of VGAM2631 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM74.Sorting Nexin 9 (SNX9, Accession NM_016224) is another VGAM2631 host target gene. SNX9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:18331, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88644] Another function of VGAM2631 is therefore inhibition of Sorting Nexin 9 (SNX9, Accession NM_016224). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172) is another VGAM2631 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30434, to the nucleotide sequence of

VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88645] Another function of VGAM2631 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. DKFZP564O1664 (Accession NM_030800) is another VGAM2631 host target gene. DKFZP564O1664 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O1664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O1664 BINDING SITE, designated SEQ ID:25101, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88646] Another function of VGAM2631 is therefore inhibition of DKFZP564O1664 (Accession NM_030800). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O1664. MGC16186 (Accession

NM_032372) is another VGAM2631 host target gene. MGC16186 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16186 BINDING SITE, designated SEQ ID:26160, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88647] Another function of VGAM2631 is therefore inhibition of MGC16186 (Accession NM_032372). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16186. Testis-specific Kinase 2 (TESK2, Accession XM_032399) is another VGAM2631 host target gene. TESK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TESK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK2 BINDING SITE, designated SEQ ID:31648, to the nucleotide sequence of VGAM2631 RNA,

herein designated VGAM RNA, also designated SEQ ID:5342.

[88648] Another function of VGAM2631 is therefore inhibition of Testis-specific Kinase 2 (TESK2, Accession XM_032399). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TESK2. LOC150157 (Accession XM_097823) is another VGAM2631 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41144, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88649] Another function of VGAM2631 is therefore inhibition of LOC150157 (Accession XM_097823). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC201685 (Accession XM_117325) is another VGAM2631 host target gene. LOC201685 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201685 BINDING SITE, designated SEQ ID:43384, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88650] Another function of VGAM2631 is therefore inhibition of LOC201685 (Accession XM_117325). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201685. LOC253150 (Accession XM_170948) is another VGAM2631 host target gene. LOC253150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253150 BINDING SITE, designated SEQ ID:45732, to the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, also designated SEQ ID:5342.

[88651] Another function of VGAM2631 is therefore inhibition of

LOC253150 (Accession XM_170948). Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253150. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2632 (VGAM2632) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88652] VGAM2632 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2632 was detected is described hereinabove with reference to Figs. 1-8.

[88653] VGAM2632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tamana Bat Virus. VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88654] VGAM2632 gene encodes a VGAM2632 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2632 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2632 precursor RNA is designated SEQ ID:2618, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2618 is located at position 1113 relative to the genome of Tamana Bat Virus.

[88655] VGAM2632 precursor RNA folds onto itself, forming VGAM2632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88656] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2632 folded precursor RNA into VGAM2632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM2632 RNA is designated SEQ ID:5343, and is provided hereinbelow with reference to the sequence listing part.

[88657] VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2632 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88658] VGAM2632 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2632 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88659] The complementary binding of VGAM2632 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2632 host target RNA into VGAM2632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88660] It is appreciated that VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2632 host target genes. The mRNA of each one of this plurality of VGAM2632 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2632 RNA, herein designated VGAM RNA, and which when bound by VGAM2632 RNA causes inhibition of translation of respective one or more VGAM2632 host target proteins.

[88661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2632 gene, herein designated VGAM GENE, on one or more VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88662] It is yet further appreciated that a function of VGAM2632

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2632 include diagnosis, prevention and treatment of viral infection by Tamana Bat Virus. Specific functions, and accordingly utilities, of VGAM2632 correlate with, and may be deduced from, the identity of the host target genes which VGAM2632 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88663] Nucleotide sequences of the VGAM2632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2632 are further described hereinbelow with reference to Table 1.

[88664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2632 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2632 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88665] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2632 gene, herein designated VGAM is inhibition of expression of VGAM2632 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2632 correlate with, and may be deduced from, the identity of the target genes which VGAM2632 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88666] FLJ10996 (Accession NM_019044) is a VGAM2632 host target gene. FLJ10996 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10996 BINDING SITE, designated SEQ ID:21126, to the nucleotide sequence of VGAM2632 RNA, herein designated VGAM RNA, also designated SEQ ID:5343.

[88667] A function of VGAM2632 is therefore inhibition of FLJ10996 (Accession NM_019044). Accordingly, utilities of VGAM2632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10996. Fig. 1 further provides a conceptual description

of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2633 (VGAM2633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88668] VGAM2633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2633 was detected is described hereinabove with reference to Figs. 1-8.

[88669] VGAM2633 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tamana Bat Virus. VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88670] VGAM2633 gene encodes a VGAM2633 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2633 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2633 precursor RNA is designated SEQ ID:2619, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2619 is located at position 3876 relative to the genome of Tamana Bat Virus.

[88671] VGAM2633 precursor RNA folds onto itself, forming VGAM2633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[88672] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2633 folded precursor RNA into VGAM2633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2633 RNA is designated SEQ ID:5344, and is provided hereinbelow with reference to the sequence listing part.

[88673] VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2633 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88674] VGAM2633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2633 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2633 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88675] The complementary binding of VGAM2633 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2633 host target RNA into VGAM2633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88676] It is appreciated that VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2633 host target genes. The mRNA of each one of this plurality of VGAM2633 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2633 RNA, herein designated VGAM RNA, and which when bound by VGAM2633 RNA causes inhibition of translation of respective one or more VGAM2633 host target proteins.

[88677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2633 gene, herein designated VGAM GENE, on one or more VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88678] It is yet further appreciated that a function of VGAM2633 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of viral infection by Tamana Bat Virus. Specific functions, and accordingly utilities, of VGAM2633 correlate with, and may be deduced from, the identity of the host target genes which VGAM2633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88679] Nucleotide sequences of the VGAM2633 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2633 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2633 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2633 are further described hereinbelow with reference to Table 1.

[88680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2633 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2633 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88681] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2633 gene, herein designated VGAM is inhibition of expression of VGAM2633 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2633 correlate with, and may be deduced from, the identity of the target genes which VGAM2633 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88682] Cyclin D-type Binding-protein 1 (CCNDBP1, Accession NM_037370) is a VGAM2633 host target gene. CCNDBP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CCNDBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CCNDBP1 BINDING SITE, designated SEQ ID:27398, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88683] A function of VGAM2633 is therefore inhibition of Cyclin D-type Binding-protein 1 (CCNDBP1, Accession NM_037370). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNDBP1. Collagen, Type VI, Alpha 3 (COL6A3, Accession NM_004369) is another VGAM2633 host target gene. COL6A3 BINDING SITE1 and COL6A3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL6A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL6A3 BINDING SITE1 and COL6A3 BINDING SITE2, designated SEQ ID:10588 and SEQ ID:27672 respectively, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88684] Another function of VGAM2633 is therefore inhibition of

Collagen, Type VI, Alpha 3 (COL6A3, Accession NM_004369). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A3. BDG-29 (Accession XM_051343) is another VGAM2633 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35819, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88685] Another function of VGAM2633 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. FLJ20275 (Accession NM_017737) is another VGAM2633 host target gene. FLJ20275 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20275 BINDING SITE, designated SEQ ID:19323, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88686] Another function of VGAM2633 is therefore inhibition of FLJ20275 (Accession NM_017737). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20275. HBP1 (Accession NM_012257) is another VGAM2633 host target gene. HBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBP1 BINDING SITE, designated SEQ ID:14560, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88687] Another function of VGAM2633 is therefore inhibition of HBP1 (Accession NM_012257). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBP1.

Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM2633 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32530, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88688] Another function of VGAM2633 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. MAN1 (Accession NM_014319) is another VGAM2633 host target gene. MAN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1 BINDING SITE, designated SEQ ID:15617, to the nucleotide sequence of VGAM2633 RNA,

herein designated VGAM RNA, also designated SEQ ID:5344.

[88689] Another function of VGAM2633 is therefore inhibition of MAN1 (Accession NM_014319). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1. MGC16142 (Accession NM_032763) is another VGAM2633 host target gene. MGC16142 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16142 BINDING SITE, designated SEQ ID:26509, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88690] Another function of VGAM2633 is therefore inhibition of MGC16142 (Accession NM_032763). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16142. MGC2827 (Accession NM_023940) is another VGAM2633 host target gene. MGC2827 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by MGC2827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2827 BINDING SITE, designated SEQ ID:23426, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88691] Another function of VGAM2633 is therefore inhibition of MGC2827 (Accession NM_023940). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2827. Tetratricopeptide Repeat Domain 4 (TTC4, Accession XM_038926) is another VGAM2633 host target gene. TTC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC4 BINDING SITE, designated SEQ ID:32961, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88692] Another function of VGAM2633 is therefore inhibition of Tetratricopeptide Repeat Domain 4 (TTC4, Accession

XM_038926). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC4. LOC150606 (Accession XM_097928) is another VGAM2633 host target gene. LOC150606 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150606 BINDING SITE, designated SEQ ID:41235, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88693] Another function of VGAM2633 is therefore inhibition of LOC150606 (Accession XM_097928). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150606. LOC91813 (Accession XM_040862) is another VGAM2633 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33401, to the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, also designated SEQ ID:5344.

[88694] Another function of VGAM2633 is therefore inhibition of LOC91813 (Accession XM_040862). Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2634 (VGAM2634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88695] VGAM2634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2634 was detected is described hereinabove with reference to Figs. 1-8.

[88696] VGAM2634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tamana Bat Virus. VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[88697] VGAM2634 gene encodes a VGAM2634 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2634 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2634 precursor RNA is designated SEQ ID:2620, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2620 is located at position 3523 relative to the genome of Tamana Bat Virus.

[88698] VGAM2634 precursor RNA folds onto itself, forming VGAM2634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88699] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2634 folded precursor RNA into VGAM2634 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2634 RNA is designated SEQ ID:5345, and is provided hereinbelow with reference to the sequence listing part.

[88700] VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2634 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88701] VGAM2634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2634 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88702] The complementary binding of VGAM2634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2634 host target RNA into VGAM2634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88703] It is appreciated that VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2634 host target genes. The mRNA of each one of this plurality of VGAM2634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2634 RNA, herein designated VGAM RNA, and which when bound by VGAM2634 RNA causes inhibition of translation of respective one or more VGAM2634 host target proteins.

[88704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2634 gene, herein designated VGAM GENE, on one or more VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88705] It is yet further appreciated that a function of VGAM2634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of viral infection by Tamana Bat Virus. Specific functions, and accordingly utilities, of VGAM2634 correlate with, and may be deduced from, the identity of the host target genes which VGAM2634 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88706] Nucleotide sequences of the VGAM2634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2634 are further described hereinbelow with reference to Table 1.

[88707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2634 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88708] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2634 gene, herein designated VGAM is inhibition of expression of VGAM2634 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2634 correlate with, and may be deduced from, the identity of the target genes which VGAM2634 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88709] ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681) is a VGAM2634 host target gene. ATP2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A2 BINDING SITE, designated SEQ ID:7403, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5345.

[88710] A function of VGAM2634 is therefore inhibition of ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A2. Cartilage Associated Protein (CRTAP, Accession NM_006371) is another VGAM2634 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13064, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88711] Another function of VGAM2634 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP.

The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.RNTRE (Accession NM_014688) is another VGAM2634 host target gene. RNTRE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNTRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNTRE BINDING SITE, designated SEQ ID:16189, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88712] Another function of VGAM2634 is therefore inhibition of RNTRE (Accession NM_014688), a gene which may be involved in cell proliferation. Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNTRE. The function of RNTRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379.T-box 5 (TBX5, Accession NM_080717) is another VGAM2634 host target gene. TBX5 BINDING SITE1

and TBX5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TBX5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX5 BINDING SITE1 and TBX5 BINDING SITE2, designated SEQ ID:28015 and SEQ ID:5691 respectively, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88713] Another function of VGAM2634 is therefore inhibition of T-box 5 (TBX5, Accession NM_080717). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX5. Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM_017770) is another VGAM2634 host target gene. ELOVL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELOVL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELOVL2 BINDING SITE, designated SEQ ID:19389, to the nucleotide sequence of VGAM2634 RNA,

herein designated VGAM RNA, also designated SEQ ID:5345.

[88714] Another function of VGAM2634 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM_017770). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL2. FLJ13110 (Accession NM_022912) is another VGAM2634 host target gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23224, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88715] Another function of VGAM2634 is therefore inhibition of FLJ13110 (Accession NM_022912). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. LOC200339 (Accession XM_117226) is another

VGAM2634 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:43303, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88716] Another function of VGAM2634 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC257407 (Accession XM_173078) is another VGAM2634 host target gene. LOC257407 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257407 BINDING SITE, designated SEQ ID:46338, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88717] Another function of VGAM2634 is therefore inhibition of LOC257407 (Accession XM_173078). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257407. LOC92997 (Accession XM_048690) is another VGAM2634 host target gene. LOC92997 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92997 BINDING SITE, designated SEQ ID:35222, to the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, also designated SEQ ID:5345.

[88718] Another function of VGAM2634 is therefore inhibition of LOC92997 (Accession XM_048690). Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2635 (VGAM2635) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[88719] VGAM2635 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2635 was detected is described hereinabove with reference to Figs. 1-8.

[88720] VGAM2635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tamana Bat Virus. VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88721] VGAM2635 gene encodes a VGAM2635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2635 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2635 precursor RNA is designated SEQ ID:2621, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2621 is located at position 2105 relative to the genome of Tamana Bat Virus.

[88722] VGAM2635 precursor RNA folds onto itself, forming VGAM2635 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88723] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2635 folded precursor RNA into VGAM2635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2635 RNA is designated SEQ ID:5346, and is provided hereinbelow with reference to the sequence listing part.

[88724] VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2635 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88725] VGAM2635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2635 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88726] The complementary binding of VGAM2635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2635 host target RNA into VGAM2635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88727] It is appreciated that VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2635 host target genes. The mRNA of each one of this plurality of VGAM2635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2635 RNA, herein designated VGAM RNA, and which when bound by VGAM2635 RNA causes inhibition of translation of respective one or more VGAM2635 host target proteins.

[88728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2635 gene, herein designated VGAM GENE, on one or more VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88729] It is yet further appreciated that a function of VGAM2635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of viral infection by Tamana Bat Virus. Specific functions, and accordingly utilities, of VGAM2635 correlate with, and may be deduced from, the identity of the host target genes which VGAM2635 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[88730] Nucleotide sequences of the VGAM2635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2635 are further described hereinbelow with reference to Table 1.

[88731] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2635 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88732] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2635 gene, herein designated VGAM is inhibition of expression of VGAM2635 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2635 correlate with, and may be deduced from, the identity of the target genes which VGAM2635 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88733] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783) is a VGAM2635 host target gene. B3GALT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by B3GALT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT2 BINDING SITE, designated SEQ ID:9872, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88734] A function of VGAM2635 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT2. Like-glycosyltransferase (LARGE, Accession NM_004737) is another VGAM2635 host target gene. LARGE BINDING SITE1 and LARGE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LARGE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LARGE BINDING SITE1 and LARGE BINDING SITE2, designated SEQ ID:11127 and SEQ ID:28599 respectively, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88735] Another function of VGAM2635 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NM_004737), a gene which is a member of the N-acetylglucosaminyltransferase family. Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE. The function of LARGE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM205.Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_139202) is another VGAM2635 host target gene. MLC1 BINDING SITE1 and MLC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLC1 BINDING SITE1 and

MLC1 BINDING SITE2, designated SEQ ID:29218 and SEQ ID:14909 respectively, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88736] Another function of VGAM2635 is therefore inhibition of Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_139202). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLC1. RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134422) is another VGAM2635 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28649, SEQ ID:28657 and SEQ ID:28665 respectively, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88737] Another function of VGAM2635 is therefore inhibition of

RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134422). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. Chromosome 21 Open Reading Frame 93 (C21orf93, Accession NM_145179) is another VGAM2635 host target gene. C21orf93 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C21orf93, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf93 BINDING SITE, designated SEQ ID:29741, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88738] Another function of VGAM2635 is therefore inhibition of Chromosome 21 Open Reading Frame 93 (C21orf93, Accession NM_145179). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf93. DKFZP434H132 (Accession XM_057020) is another VGAM2635 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36448, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88739] Another function of VGAM2635 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. Forkhead Box H1 (FOXH1, Accession NM_003923) is another VGAM2635 host target gene. FOXH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXH1 BINDING SITE, designated SEQ ID:10011, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88740] Another function of VGAM2635 is therefore inhibition of Forkhead Box H1 (FOXH1, Accession NM_003923). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXH1. KIAA1468 (Accession XM_166289) is another VGAM2635 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44099, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88741] Another function of VGAM2635 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. Triple Homeobox 1 (TIX1, Accession XM_029734) is another VGAM2635 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:30928, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88742] Another function of VGAM2635 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM_029734). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1. LOC148759 (Accession XM_097517) is another VGAM2635 host target gene. LOC148759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148759 BINDING SITE, designated SEQ ID:40904, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88743] Another function of VGAM2635 is therefore inhibition of LOC148759 (Accession XM_097517). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148759. LOC153937 (Accession XM_087813) is another VGAM2635 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39447, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88744] Another function of VGAM2635 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. LOC200845 (Accession XM_114305) is another VGAM2635 host target gene. LOC200845 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200845 BINDING SITE, designated SEQ ID:42863, to

the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88745] Another function of VGAM2635 is therefore inhibition of LOC200845 (Accession XM_114305). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200845. LOC220776 (Accession XM_043388) is another VGAM2635 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33932, to the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, also designated SEQ ID:5346.

[88746] Another function of VGAM2635 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2636 (VGAM2636) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88747] VGAM2636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2636 was detected is described hereinabove with reference to Figs. 1-8.

[88748] VGAM2636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88749] VGAM2636 gene encodes a VGAM2636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2636 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2636 precursor RNA is designated SEQ ID:2622, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2622 is located at position 25048 relative to the genome of Sheeppox Virus.

[88750] VGAM2636 precursor RNA folds onto itself, forming VGAM2636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88751] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2636 folded precursor RNA into VGAM2636 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2636 RNA is designated SEQ ID:5347, and is provided hereinbelow with reference to the sequence listing part.

[88752] VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2636 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2636 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88753] VGAM2636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2636 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2636 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88754] The complementary binding of VGAM2636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2636 host target RNA into VGAM2636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88755] It is appreciated that VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2636 host target genes. The mRNA of each one of this plurality of VGAM2636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2636 RNA, herein designated VGAM RNA, and which when bound by VGAM2636 RNA causes inhibition of translation of respective one or more VGAM2636 host target proteins.

[88756] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2636 gene, herein designated VGAM GENE, on one or more VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88757] It is yet further appreciated that a function of VGAM2636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM2636 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2636 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88758] Nucleotide sequences of the VGAM2636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2636 are further described hereinbelow with reference to Table 1.

[88759] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2636 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2636 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88760] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2636 gene, herein designated VGAM is inhibition of expression of VGAM2636 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2636 correlate with, and may be deduced from, the identity of the target genes which VGAM2636

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88761] Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is a VGAM2636 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15286, to the nucleotide sequence of VGAM2636 RNA, herein designated VGAM RNA, also designated SEQ ID:5347.

[88762] A function of VGAM2636 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3,

Accession NM_004172) is another VGAM2636 host target gene. SLC1A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A3 BINDING SITE, designated SEQ ID:10385, to the nucleotide sequence of VGAM2636 RNA, herein designated VGAM RNA, also designated SEQ ID:5347.

[88763] Another function of VGAM2636 is therefore inhibition of Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM_004172), a gene which is a transporter molecule that regulates neurotransmitter concentrations at excitatory synapses of the mammalian cns. Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A3. The function of SLC1A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM294.Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM_002056) is another

VGAM2636 host target gene. GFPT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFPT1 BINDING SITE, designated SEQ ID:7817, to the nucleotide sequence of VGAM2636 RNA, herein designated VGAM RNA, also designated SEQ ID:5347.

[88764] Another function of VGAM2636 is therefore inhibition of Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM_002056). Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFPT1. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445) is another VGAM2636 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28527, to the nucleotide sequence of

VGAM2636 RNA, herein designated VGAM RNA, also designated SEQ ID:5347.

[88765] Another function of VGAM2636 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445). Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. KIAA1674 (Accession XM_044065) is another VGAM2636 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34115, to the nucleotide sequence of VGAM2636 RNA, herein designated VGAM RNA, also designated SEQ ID:5347.

[88766] Another function of VGAM2636 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. LOC51125 (Accession NM_016099) is another VGAM2636 host target gene. LOC51125 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51125 BINDING SITE, designated SEQ ID:18182, to the nucleotide sequence of VGAM2636 RNA, herein designated VGAM RNA, also designated SEQ ID:5347.

[88767] Another function of VGAM2636 is therefore inhibition of LOC51125 (Accession NM_016099). Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51125. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2637 (VGAM2637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88768] VGAM2637 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2637 was detected is described hereinabove with reference to Figs. 1-8.

[88769] VGAM2637 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88770] VGAM2637 gene encodes a VGAM2637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2637 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2637 precursor RNA is designated SEQ ID:2623, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2623 is located at position 24739 relative to the genome of Goatpox Virus.

[88771] VGAM2637 precursor RNA folds onto itself, forming VGAM2637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[88772] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2637 folded precursor RNA into VGAM2637 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2637 RNA is designated SEQ ID:5348, and is provided hereinbelow with reference to the sequence listing part.

[88773] VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2637 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88774] VGAM2637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2637 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2637 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2637 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88775] The complementary binding of VGAM2637 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2637 host target RNA into VGAM2637 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88776] It is appreciated that VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2637 host target genes. The mRNA of each one of this plurality of VGAM2637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2637 RNA, herein designated VGAM RNA, and which when bound by VGAM2637 RNA causes inhibition of translation of respective one or more VGAM2637 host target proteins.

[88777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2637 gene, herein designated VGAM GENE, on one or more VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88778] It is yet further appreciated that a function of VGAM2637 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2637 correlate with, and may be deduced from, the identity of the host target genes which VGAM2637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88779] Nucleotide sequences of the VGAM2637 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2637 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2637 are further described hereinbelow with reference to Table 1.

[88780] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2637 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88781] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2637 gene, herein designated VGAM is inhibition of expression of VGAM2637 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2637 correlate with, and may be deduced from, the identity of the target genes which VGAM2637 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88782] Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_000962) is a VGAM2637 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET bind-

ing sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:6671 and SEQ ID:27892 respectively, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88783] A function of VGAM2637 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_000962), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.Von Hippel-Lindau Binding Protein 1 (VBP1, Accession NM_003372) is another VGAM2637 host target gene. VBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VBP1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VBP1 BINDING SITE, designated SEQ ID:9398, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88784] Another function of VGAM2637 is therefore inhibition of Von Hippel-Lindau Binding Protein 1 (VBP1, Accession NM_003372), a gene which binds specifically to cytosolic chaperonin (c-cpn) and transfers target proteins to it. Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VBP1. The function of VBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM945.Ras Homolog Gene Family, Member E (ARHE, Accession NM_005168) is another VGAM2637 host target gene. ARHE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BIND-

ING SITE, designated SEQ ID:11667, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88785] Another function of VGAM2637 is therefore inhibition of Ras Homolog Gene Family, Member E (ARHE, Accession NM_005168). Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. FLJ10139 (Accession NM_018005) is another VGAM2637 host target gene. FLJ10139 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10139 BINDING SITE, designated SEQ ID:19734, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88786] Another function of VGAM2637 is therefore inhibition of FLJ10139 (Accession NM_018005). Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10139. KIAA1655 (Accession XM_039442) is another

VGAM2637 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33090, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88787] Another function of VGAM2637 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. NY-REN-25 (Accession XM_027116) is another VGAM2637 host target gene. NY-REN-25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30414, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88788] Another function of VGAM2637 is therefore inhibition of NY-REN-25 (Accession XM_027116). Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. RoXaN (Accession NM_025013) is another VGAM2637 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24599, to the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, also designated SEQ ID:5348.

[88789] Another function of VGAM2637 is therefore inhibition of RoXaN (Accession NM_025013). Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2638 (VGAM2638) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[88790] VGAM2638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2638 was detected is described hereinabove with reference to Figs. 1-8.

[88791] VGAM2638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88792] VGAM2638 gene encodes a VGAM2638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2638 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2638 precursor RNA is designated SEQ ID:2624, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2624 is located at position 3143 relative to the genome of Foot-and-mouth Disease Virus O.

[88793] VGAM2638 precursor RNA folds onto itself, forming VGAM2638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88794] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2638 folded precursor RNA into VGAM2638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2638 RNA is designated SEQ ID:5349, and is provided hereinbelow with reference to the sequence listing part.

[88795] VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2638 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88796] VGAM2638 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2638 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[88797] The complementary binding of VGAM2638 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2638 host target RNA into VGAM2638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88798] It is appreciated that VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2638 host target genes. The mRNA of each one of this plurality of VGAM2638 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2638 RNA, herein designated VGAM RNA, and which when bound by VGAM2638 RNA causes inhibition of translation of respective one or more VGAM2638 host target proteins.

[88799] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2638 gene, herein designated VGAM GENE, on one

or more VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88800] It is yet further appreciated that a function of VGAM2638 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM2638 correlate with, and may be deduced from, the identity of the host target genes which VGAM2638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88801] Nucleotide sequences of the VGAM2638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2638 are further described hereinbelow with reference to Table 1.

[88802] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2638 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2638 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88803] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2638 gene, herein designated VGAM is inhibition of expression of VGAM2638 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2638 correlate with, and may be deduced from, the identity of the target genes which VGAM2638 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88804] Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Acces-

sion NM_002015) is a VGAM2638 host target gene. FOXO1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXO1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:7756, to the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, also designated SEQ ID:5349.

[88805] A function of VGAM2638 is therefore inhibition of Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM_002015), a gene which is a probable transcription factor. Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO1A. The function of FOXO1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228.Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM_000330) is another VGAM2638 host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RS1, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RS1 BINDING SITE, designated SEQ ID:5873, to the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, also designated SEQ ID:5349.

[88806] Another function of VGAM2638 is therefore inhibition of Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM_000330). Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RS1. Cadherin-like 26 (CDH26, Accession NM_021810) is another VGAM2638 host target gene. CDH26 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDH26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH26 BINDING SITE, designated SEQ ID:22370, to the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, also designated SEQ ID:5349.

[88807] Another function of VGAM2638 is therefore inhibition of Cadherin-like 26 (CDH26, Accession NM_021810). Ac-

cordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH26. ZER6 (Accession XM_032742) is another VGAM2638 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31747, to the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, also designated SEQ ID:5349.

[88808] Another function of VGAM2638 is therefore inhibition of ZER6 (Accession XM_032742). Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. LOC196527 (Accession XM_113743) is another VGAM2638 host target gene. LOC196527 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC196527 BINDING SITE, designated SEQ ID:42397, to the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, also designated SEQ ID:5349.

[88809] Another function of VGAM2638 is therefore inhibition of LOC196527 (Accession XM_113743). Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196527. LOC220954 (Accession XM_167628) is another VGAM2638 host target gene. LOC220954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220954 BINDING SITE, designated SEQ ID:44736, to the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, also designated SEQ ID:5349.

[88810] Another function of VGAM2638 is therefore inhibition of LOC220954 (Accession XM_167628). Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220954. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2639 (VGAM2639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88811] VGAM2639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2639 was detected is described hereinabove with reference to Figs. 1-8.

[88812] VGAM2639 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88813] VGAM2639 gene encodes a VGAM2639 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2639 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2639 precursor RNA is designated SEQ ID:2625, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2625 is located at position 2526 relative to the

genome of Foot-and-mouth Disease Virus O.

[88814] VGAM2639 precursor RNA folds onto itself, forming VGAM2639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88815] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2639 folded precursor RNA into VGAM2639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2639 RNA is designated SEQ ID:5350, and is provided hereinbelow with reference to the sequence listing part.

[88816] VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2639 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88817] VGAM2639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2639 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2639 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88818] The complementary binding of VGAM2639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2639 host target RNA into VGAM2639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88819] It is appreciated that VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2639 host target genes. The mRNA of each one of this plurality of VGAM2639 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2639 RNA, herein designated VGAM RNA, and which when bound by VGAM2639 RNA causes inhibition of translation of respective one or more VGAM2639 host target proteins.

[88820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2639 gene, herein designated VGAM GENE, on one or more VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88821] It is yet further appreciated that a function of VGAM2639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of

VGAM2639 correlate with, and may be deduced from, the identity of the host target genes which VGAM2639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88822] Nucleotide sequences of the VGAM2639 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2639 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2639 are further described hereinbelow with reference to Table 1.

[88823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2639 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2639 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88824] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2639 gene, herein designated VGAM is inhibition of expression of VGAM2639 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2639 correlate with, and may be deduced

from, the identity of the target genes which VGAM2639 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88825] A Disintegrin and Metalloproteinase Domain 11 (ADAM11, Accession NM_021612) is a VGAM2639 host target gene. ADAM11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM11 BINDING SITE, designated SEQ ID:22241, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88826] A function of VGAM2639 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 11 (ADAM11, Accession NM_021612), a gene which Member of the ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM11. The function of ADAM11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM387.BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM_001186) is another VGAM2639 host target gene. BACH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BACH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH1 BINDING SITE, designated SEQ ID:6857, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88827] Another function of VGAM2639 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM_001186), a gene which acts as repressor or activator, binds to nf-e2 binding sites. Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH1. The function of BACH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM724.Carnitine Acetyltransferase (CRAT, Accession NM_004003) is an-

other VGAM2639 host target gene. CRAT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRAT BINDING SITE, designated SEQ ID:10151, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88828] Another function of VGAM2639 is therefore inhibition of Carnitine Acetyltransferase (CRAT, Accession NM_004003), a gene which catalyzes the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine. Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRAT. The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281) is another VGAM2639 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14607, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88829] Another function of VGAM2639 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM449.Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM_003242) is another VGAM2639 host target gene. TGFBR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR2 BINDING SITE, designated SEQ ID:9237, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88830] Another function of VGAM2639 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM_003242). Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR2. KIAA0628 (Accession NM_014789) is another VGAM2639 host target gene. KIAA0628 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:16674, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88831] Another function of VGAM2639 is therefore inhibition of KIAA0628 (Accession NM_014789). Accordingly, utilities of VGAM2639 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0628. KIAA0960 (Accession XM_166543) is another VGAM2639 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44516, to the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88832] Another function of VGAM2639 is therefore inhibition of KIAA0960 (Accession XM_166543). Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0960. LOC150776 (Accession XM_032542) is another VGAM2639 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31672, to

the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, also designated SEQ ID:5350.

[88833] Another function of VGAM2639 is therefore inhibition of LOC150776 (Accession XM_032542). Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2640 (VGAM2640) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88834] VGAM2640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2640 was detected is described hereinabove with reference to Figs. 1-8.

[88835] VGAM2640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88836] VGAM2640 gene encodes a VGAM2640 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2640 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2640 precursor RNA is designated SEQ ID:2626, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2626 is located at position 4136 relative to the genome of Foot-and-mouth Disease Virus O.

[88837] VGAM2640 precursor RNA folds onto itself, forming VGAM2640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88838] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2640 folded precursor RNA into VGAM2640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM2640 RNA is designated SEQ ID:5351, and is provided hereinbelow with reference to the sequence listing part.

[88839] VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2640 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88840] VGAM2640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2640 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88841] The complementary binding of VGAM2640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2640 host target RNA into VGAM2640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88842] It is appreciated that VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2640 host target genes. The mRNA of each one of this plurality of VGAM2640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2640 RNA, herein designated VGAM RNA, and which when bound by VGAM2640 RNA causes inhibition of translation of respective one or more VGAM2640 host target proteins.

[88843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2640 gene, herein designated VGAM GENE, on one or more VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88844] It is yet further appreciated that a function of VGAM2640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM2640 correlate with, and may be deduced from, the identity of the host target genes which VGAM2640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88845] Nucleotide sequences of the VGAM2640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2640 are further described hereinbelow with reference to Table 1.

[88846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2640 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2640 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88847] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2640 gene, herein designated VGAM is inhibition of expression of VGAM2640 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2640 correlate with, and may be deduced from, the identity of the target genes which VGAM2640 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88848] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM2640 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23168, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88849] A function of VGAM2640 is therefore inhibition of B-cell

CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Developmentally Regulated GTP Binding Protein 2 (DRG2, Accession NM_001388) is another VGAM2640 host target gene. DRG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DRG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRG2 BINDING SITE, designated SEQ ID:7075, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88850] Another function of VGAM2640 is therefore inhibition of Developmentally Regulated GTP Binding Protein 2 (DRG2, Accession NM_001388), a gene which may play a role in cell proliferation, differentiation and death. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRG2. The function of DRG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM2003.LFG (Accession XM_084780) is another VGAM2640 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37694, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88851] Another function of VGAM2640 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another VGAM2640 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:8318, to the nucleotide sequence of VGAM2640 RNA, herein

designated VGAM RNA, also designated SEQ ID:5351.

[88852] Another function of VGAM2640 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.RAP1, GTPase Activating Protein 1 (RAP1GA1, Accession NM_002885) is another VGAM2640 host target gene. RAP1GA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP1GA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1GA1 BINDING SITE, designated SEQ ID:8799, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88853] Another function of VGAM2640 is therefore inhibition of

RAP1, GTPase Activating Protein 1 (RAP1GA1, Accession NM_002885). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1GA1. Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM_003056) is another VGAM2640 host target gene. SLC19A1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A1 BINDING SITE, designated SEQ ID:9024, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88854] Another function of VGAM2640 is therefore inhibition of Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM_003056). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A1. SRY (sex determining region Y)-box 15 (SOX15, Accession NM_006942) is another VGAM2640 host target gene. SOX15 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by SOX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX15 BINDING SITE, designated SEQ ID:13827, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88855] Another function of VGAM2640 is therefore inhibition of SRY (sex determining region Y)-box 15 (SOX15, Accession NM_006942), a gene which is a member of the SOX gene family. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX15. The function of SOX15 has been established by previous studies. The testis-determining gene SRY (OMIM Ref. No. 480000) encodes a transcription factor characterized by a DNA-binding motif known as the HMG domain. The SOX gene family consists of genes related to SRY, with a sequence identity of more than 60% to the SRY HMG box. Other members of the SOX gene family are assumed to play a role in gonadal function: the murine Sox5 gene is expressed exclusively in post-meiotic germ cells. SOX4 (OMIM Ref. No. 184430) is

expressed in brain, heart, and testis. Mutations in the human SOX9 gene (OMIM Ref. No. 114290) cause a skeletal dysplasia, campomelic dysplasia associated with autosomal sex reversal. By use of a SOX9 cDNA as a hybridization probe, Meyer et al. (1996) discovered a new member of the SOX gene family, designated SOX20. They found that SOX20 has a high similarity to the deduced amino acid sequence of human SOX12 and murine Sox16 HMG domains. By fluorescence in situ hybridization (FISH), Meyer et al. (1996) mapped the SOX20 gene to 17p13. Critcher et al. (1998) used FISH to refine the localization to 17p12.3. Vujic et al. (1998) assigned the SOX20 gene to 17p13.1 by the study of a radiation hybrid panel.

[88856] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[88857] Meyer, J.; Wirth, J.; Held, M.; Schempp, W.; Scherer, G. : SOX20, a new member of the SOX gene family, is located on chromosome 17p13. Cytogenet. Cell Genet. 72: 246-249, 1996. ; and

[88858] Vujic, M.; Rajic, T.; Goodfellow, P. N.; Stevanovic, M. : cDNA characterization and high resolution mapping of the human SOX20 gene. Mammalian Genome 9: 1059-1061,

1998.

[88859] Further studies establishing the function and utilities of SOX15 are found in John Hopkins OMIM database record ID 601297, and in sited publications numbered 12406-6897 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243) is another VGAM2640 host target gene. TNFRSF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE, designated SEQ ID:6910, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88860] Another function of VGAM2640 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243), a gene which regulates gene expression through activation of nf-kappab. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with TNFRSF8. The function of TNFRSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM154.Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349) is another VGAM2640 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:9373, SEQ ID:22772 and SEQ ID:22525 respectively, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88861] Another function of VGAM2640 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The func-

tion of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228) is another VGAM2640 host target gene. C20orf18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf18 BINDING SITE, designated SEQ ID:25276, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88862] Another function of VGAM2640 is therefore inhibition of Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf18. CDT1 (Accession XM_085327) is another VGAM2640 host target gene. CDT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDT1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT1 BINDING SITE, designated SEQ ID:38067, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88863] Another function of VGAM2640 is therefore inhibition of CDT1 (Accession XM_085327). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT1. Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM_086803) is another VGAM2640 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE, designated SEQ ID:38880, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88864] Another function of VGAM2640 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM_086803). Accordingly, utilities of

VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7. Carbohydrate (N-acetylgalactosamine 4-0) Sulfotransferase 8 (CHST8, Accession NM_022467) is another VGAM2640 host target gene. CHST8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CHST8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST8 BINDING SITE, designated SEQ ID:22818, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88865] Another function of VGAM2640 is therefore inhibition of Carbohydrate (N-acetylgalactosamine 4-0) Sulfotransferase 8 (CHST8, Accession NM_022467). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST8. DKFZP434H132 (Accession XM_057020) is another VGAM2640 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36450, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88866] Another function of VGAM2640 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. Delta-like 1 (Drosophila) (DLL1, Accession NM_005618) is another VGAM2640 host target gene. DLL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DLL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLL1 BINDING SITE, designated SEQ ID:12134, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88867] Another function of VGAM2640 is therefore inhibition of Delta-like 1 (Drosophila) (DLL1, Accession NM_005618). Accordingly, utilities of VGAM2640 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with DLL1. FLJ10242 (Accession NM_018036) is another VGAM2640 host target gene. FLJ10242 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10242 BINDING SITE, designated SEQ ID:19776, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88868] Another function of VGAM2640 is therefore inhibition of FLJ10242 (Accession NM_018036). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10242. FLJ12076 (Accession NM_025187) is another VGAM2640 host target gene. FLJ12076 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12076

BINDING SITE, designated SEQ ID:24826, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88869] Another function of VGAM2640 is therefore inhibition of FLJ12076 (Accession NM_025187). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12076. Myelin Transcription Factor 1 (MYT1, Accession NM_004535) is another VGAM2640 host target gene. MYT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYT1 BINDING SITE, designated SEQ ID:10877, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88870] Another function of VGAM2640 is therefore inhibition of Myelin Transcription Factor 1 (MYT1, Accession NM_004535). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYT1. TAO1 (Accession NM_004783) is another VGAM2640 host target gene.

TAO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAO1 BINDING SITE, designated SEQ ID:11191, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88871] Another function of VGAM2640 is therefore inhibition of TAO1 (Accession NM_004783). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAO1. Zinc Finger Protein 282 (ZNF282, Accession XM_114578) is another VGAM2640 host target gene. ZNF282 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF282 BINDING SITE, designated SEQ ID:42992, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88872] Another function of VGAM2640 is therefore inhibition of

Zinc Finger Protein 282 (ZNF282, Accession XM_114578). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF282. LOC112868 (Accession XM_053402) is another VGAM2640 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36083, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88873] Another function of VGAM2640 is therefore inhibition of LOC112868 (Accession XM_053402). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC126661 (Accession XM_059061) is another VGAM2640 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36850, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88874] Another function of VGAM2640 is therefore inhibition of LOC126661 (Accession XM_059061). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC130470 (Accession XM_059437) is another VGAM2640 host target gene. LOC130470 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130470 BINDING SITE, designated SEQ ID:36990, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88875] Another function of VGAM2640 is therefore inhibition of LOC130470 (Accession XM_059437). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC130470. LOC150095 (Accession XM_097805) is another VGAM2640 host target gene. LOC150095 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150095 BINDING SITE, designated SEQ ID:41130, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88876] Another function of VGAM2640 is therefore inhibition of LOC150095 (Accession XM_097805). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150095. LOC158267 (Accession XM_088528) is another VGAM2640 host target gene. LOC158267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158267 BINDING SITE, designated SEQ ID:39794, to the nucleotide sequence of VGAM2640 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5351.

[88877] Another function of VGAM2640 is therefore inhibition of LOC158267 (Accession XM_088528). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158267. LOC163682 (Accession XM_099402) is another VGAM2640 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42097, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88878] Another function of VGAM2640 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC204804 (Accession XM_115599) is another VGAM2640 host target gene. LOC204804 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC204804, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204804 BINDING SITE, designated SEQ ID:43100, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88879] Another function of VGAM2640 is therefore inhibition of LOC204804 (Accession XM_115599). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204804. LOC256933 (Accession XM_172970) is another VGAM2640 host target gene. LOC256933 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256933 BINDING SITE, designated SEQ ID:46226, to the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, also designated SEQ ID:5351.

[88880] Another function of VGAM2640 is therefore inhibition of LOC256933 (Accession XM_172970). Accordingly, utilities of VGAM2640 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC256933. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2641 (VGAM2641) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88881] VGAM2641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2641 was detected is described hereinabove with reference to Figs. 1-8.

[88882] VGAM2641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88883] VGAM2641 gene encodes a VGAM2641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2641 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2641 precursor RNA is desig-

nated SEQ ID:2627, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2627 is located at position 1368 relative to the genome of Foot-and-mouth Disease Virus O.

[88884] VGAM2641 precursor RNA folds onto itself, forming VGAM2641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88885] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2641 folded precursor RNA into VGAM2641 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2641 RNA is designated SEQ ID:5352, and is provided hereinbelow with reference to the sequence

listing part.

[88886] VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2641 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88887] VGAM2641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2641 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2641 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88888] The complementary binding of VGAM2641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2641 host target RNA into VGAM2641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88889] It is appreciated that VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2641 host target genes. The mRNA of each one of this plurality of VGAM2641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2641 RNA, herein designated VGAM

RNA, and which when bound by VGAM2641 RNA causes inhibition of translation of respective one or more VGAM2641 host target proteins.

[88890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2641 gene, herein designated VGAM GENE, on one or more VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88891] It is yet further appreciated that a function of VGAM2641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2641 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM2641 correlate with, and may be deduced from, the identity of the host target genes which VGAM2641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88892] Nucleotide sequences of the VGAM2641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2641 are further described hereinbelow with reference to Table 1.

[88893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2641 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88894] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2641 gene, herein designated VGAM is

inhibition of expression of VGAM2641 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2641 correlate with, and may be deduced from, the identity of the target genes which VGAM2641 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88895] Axin 1 (AXIN1, Accession XM_027520) is a VGAM2641 host target gene. AXIN1 BINDING SITE1 and AXIN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXIN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE1 and AXIN1 BINDING SITE2, designated SEQ ID:30512 and SEQ ID:30516 respectively, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88896] A function of VGAM2641 is therefore inhibition of Axin 1 (AXIN1, Accession XM_027520). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. Fibroblast Growth Factor 5 (FGF5, Accession NM_004464) is another VGAM2641 host target gene. FGF5 BINDING

SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10775 and SEQ ID:7884 respectively, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88897] Another function of VGAM2641 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM2641 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15353, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88898] Another function of VGAM2641 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919) is another VGAM2641 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:17187, SEQ ID:28451 and SEQ ID:28468 respectively, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88899] Another function of VGAM2641 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Caspase Recruitment Domain Family, Member 9 (CARD9, Accession NM_022352) is another VGAM2641 host target gene. CARD9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD9 BINDING SITE, designated SEQ ID:22747, to the nucleotide se-

quence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88900] Another function of VGAM2641 is therefore inhibition of Caspase Recruitment Domain Family, Member 9 (CARD9, Accession NM_022352). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD9. Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM_020248) is another VGAM2641 host target gene. CTNNBIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNNBIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:21545, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88901] Another function of VGAM2641 is therefore inhibition of Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM_020248). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1. FLJ12960

(Accession NM_024638) is another VGAM2641 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:23918, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88902] Another function of VGAM2641 is therefore inhibition of FLJ12960 (Accession NM_024638). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960. FLJ13441 (Accession NM_023924) is another VGAM2641 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23396, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM

RNA, also designated SEQ ID:5352.

[88903] Another function of VGAM2641 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. FLJ20452 (Accession NM_017828) is another VGAM2641 host target gene. FLJ20452 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20452 BINDING SITE, designated SEQ ID:19489, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88904] Another function of VGAM2641 is therefore inhibition of FLJ20452 (Accession NM_017828). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20452. KIAA0329 (Accession NM_014844) is another VGAM2641 host target gene. KIAA0329 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0329, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE, designated SEQ ID:16875, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88905] Another function of VGAM2641 is therefore inhibition of KIAA0329 (Accession NM_014844). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0329. KIAA1126 (Accession XM_050325) is another VGAM2641 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35608, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88906] Another function of VGAM2641 is therefore inhibition of KIAA1126 (Accession XM_050325). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1126. KIAA1550 (Accession XM_039393) is another VGAM2641 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33065, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88907] Another function of VGAM2641 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. KIAA1918 (Accession XM_054951) is another VGAM2641 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36216, to the

nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88908] Another function of VGAM2641 is therefore inhibition of KIAA1918 (Accession XM_054951). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. KIAA1970 (Accession XM_058808) is another VGAM2641 host target gene. KIAA1970 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1970 BINDING SITE, designated SEQ ID:36754, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88909] Another function of VGAM2641 is therefore inhibition of KIAA1970 (Accession XM_058808). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1970. RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM_080594) is another VGAM2641 host target gene. RNPS1 BINDING SITE1 and RNPS1 BIND-

ING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNPS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2, designated SEQ ID:27903 and SEQ ID:13538 respectively, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88910] Another function of VGAM2641 is therefore inhibition of RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM_080594). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPS1. LOC147054 (Accession XM_097172) is another VGAM2641 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40791, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5352.

[88911] Another function of VGAM2641 is therefore inhibition of LOC147054 (Accession XM_097172). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC147817 (Accession XM_085903) is another VGAM2641 host target gene. LOC147817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38386, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88912] Another function of VGAM2641 is therefore inhibition of LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC149345 (Accession XM_086502) is another VGAM2641 host target gene. LOC149345 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149345, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149345 BINDING SITE, designated SEQ ID:38714, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88913] Another function of VGAM2641 is therefore inhibition of LOC149345 (Accession XM_086502). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149345. LOC153346 (Accession XM_098364) is another VGAM2641 host target gene. LOC153346 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153346 BINDING SITE, designated SEQ ID:41617, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88914] Another function of VGAM2641 is therefore inhibition of LOC153346 (Accession XM_098364). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153346. LOC220018 (Accession XM_167816) is another VGAM2641 host target gene. LOC220018 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220018 BINDING SITE, designated SEQ ID:44855, to the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, also designated SEQ ID:5352.

[88915] Another function of VGAM2641 is therefore inhibition of LOC220018 (Accession XM_167816). Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220018. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2642 (VGAM2642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88916] VGAM2642 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2642 was detected is described hereinabove with reference to Figs. 1-8.

[88917] VGAM2642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88918] VGAM2642 gene encodes a VGAM2642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2642 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2642 precursor RNA is designated SEQ ID:2628, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2628 is located at position 1959 relative to the genome of Foot-and-mouth Disease Virus O.

[88919] VGAM2642 precursor RNA folds onto itself, forming VGAM2642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88920] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2642 folded precursor RNA into VGAM2642 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM2642 RNA is designated SEQ ID:5353, and is provided hereinbelow with reference to the sequence listing part.

[88921] VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2642 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88922] VGAM2642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2642 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2642 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88923] The complementary binding of VGAM2642 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2642 host target RNA into VGAM2642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88924] It is appreciated that VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2642 host target genes. The mRNA of each one of this plurality of VGAM2642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2642 RNA, herein designated VGAM RNA, and which when bound by VGAM2642 RNA causes inhibition of translation of respective one or more VGAM2642 host target proteins.

[88925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2642 gene, herein designated VGAM GENE, on one or more VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88926] It is yet further appreciated that a function of VGAM2642 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM2642 correlate with, and may be deduced from, the identity of the host target genes which VGAM2642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88927] Nucleotide sequences of the VGAM2642 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2642 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2642 are further described hereinbelow with reference to Table 1.

[88928] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2642 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2642 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88929] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2642 gene, herein designated VGAM is inhibition of expression of VGAM2642 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2642 correlate with, and may be deduced from, the identity of the target genes which VGAM2642 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88930] Cytoplasmic Linker 2 (CYLN2, Accession NM_003388) is a VGAM2642 host target gene. CYLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CYLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLN2 BINDING SITE, designated SEQ ID:9425, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88931] A function of VGAM2642 is therefore inhibition of Cytoplasmic Linker 2 (CYLN2, Accession NM_003388), a gene which associates with microtubules and dendritic lamellar bodies. Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLN2. The function of CYLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94.Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM_003307) is another VGAM2642 host target gene. TRPM2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRPM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TRPM2 BINDING SITE, designated SEQ ID:9312, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88932] Another function of VGAM2642 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM_003307), a gene which may be a calcium channel. Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM2. The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928.Unc-5 Homolog B (C. elegans) (UNC5C, Accession NM_003728) is another VGAM2642 host target gene. UNC5C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UNC5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5C BINDING SITE, designated SEQ ID:9820, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ

ID:5353.

[88933] Another function of VGAM2642 is therefore inhibition of Unc-5 Homolog B (C. elegans) (UNC5C, Accession NM_003728), a gene which is a putative receptor for netrin, which is involved in axon guidance. Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5C. The function of UNC5C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298.Ankyrin Repeat and BTB (POZ) Domain Containing 1 (ABTB1, Accession NM_032548) is another VGAM2642 host target gene. ABTB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABTB1 BINDING SITE, designated SEQ ID:26272, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88934] Another function of VGAM2642 is therefore inhibition of Ankyrin Repeat and BTB (POZ) Domain Containing 1

(ABTB1, Accession NM_032548). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABTB1. ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM_001656) is another VGAM2642 host target gene. ARFD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARFD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFD1 BINDING SITE, designated SEQ ID:7371, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88935] Another function of VGAM2642 is therefore inhibition of ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM_001656). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFD1. Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM_022082) is another VGAM2642 host target gene. C20orf59 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by C20orf59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf59 BINDING SITE, designated SEQ ID:22625, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88936] Another function of VGAM2642 is therefore inhibition of Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM_022082). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf59. DKFZp566H0824 (Accession NM_017535) is another VGAM2642 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18974, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88937] Another function of VGAM2642 is therefore inhibition of DKFZp566H0824 (Accession NM_017535). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. KIAA0173 (Accession NM_014640) is another VGAM2642 host target gene. KIAA0173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0173 BINDING SITE, designated SEQ ID:16040, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88938] Another function of VGAM2642 is therefore inhibition of KIAA0173 (Accession NM_014640). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0173. MNAB (Accession NM_018835) is another VGAM2642 host target gene. MNAB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MNAB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNAB BINDING SITE, designated SEQ ID:20821, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88939] Another function of VGAM2642 is therefore inhibition of MNAB (Accession NM_018835). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNAB. LOC125268 (Accession XM_071960) is another VGAM2642 host target gene. LOC125268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, designated SEQ ID:37451, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88940] Another function of VGAM2642 is therefore inhibition of LOC125268 (Accession XM_071960). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC125268. LOC256158 (Accession XM_175125) is another VGAM2642 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46626, to the nucleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, also designated SEQ ID:5353.

[88941] Another function of VGAM2642 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2643 (VGAM2643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88942] VGAM2643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2643 was detected is described hereinabove with reference to Figs. 1-8.

[88943] VGAM2643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88944] VGAM2643 gene encodes a VGAM2643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2643 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2643 precursor RNA is designated SEQ ID:2629, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2629 is located at position 4628 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[88945] VGAM2643 precursor RNA folds onto itself, forming VGAM2643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88946] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2643 folded precursor RNA into VGAM2643 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2643 RNA is designated SEQ ID:5354, and is provided hereinbelow with reference to the sequence listing part.

[88947] VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2643 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88948] VGAM2643 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2643 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88949] The complementary binding of VGAM2643 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2643 host target RNA into VGAM2643 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88950] It is appreciated that VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2643 host target genes. The mRNA of each one of this plurality of VGAM2643 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2643 RNA, herein designated VGAM RNA, and which when bound by VGAM2643 RNA causes inhibition of translation of respective one or more VGAM2643 host target proteins.

[88951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2643 gene, herein designated VGAM GENE, on one or more VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88952] It is yet further appreciated that a function of VGAM2643 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2643 correlate with, and may be deduced from, the identity of the host target genes which VGAM2643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88953] Nucleotide sequences of the VGAM2643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2643 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2643 are further described hereinbelow with reference to Table 1.

[88954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2643 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88955] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2643 gene, herein designated VGAM is inhibition of expression of VGAM2643 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2643 correlate with, and may be deduced from, the identity of the target genes which VGAM2643 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88956] ACATN (Accession NM_004733) is a VGAM2643 host target gene. ACATN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACATN, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACATN BINDING SITE, designated SEQ ID:11109, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88957] A function of VGAM2643 is therefore inhibition of ACATN (Accession NM_004733), a gene which Putative acetyl-Coenzyme A transporter; required for the formation of O-acetylated gangliosides. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACATN. The function of ACATN has been established by previous studies. The structural diversity and complexity of sugar chains in membrane gangliosides are caused in part by the occurrence of several different species of sialic acid molecules, including O-acetylated forms. Acetylation of sialic acid residues of glycoproteins and gangliosides occurs in the lumen of the Golgi apparatus, using acetyl-CoA as the acetate donor. By expression cloning, Kanamori et al. (1997) isolated a human melanoma cell line cDNA encoding AT1, a protein that directed the formation of 9-O-acetylated ganglioside GD3 in mammalian

cells. The predicted 549-amino acid protein contained 6 to 10 transmembrane domains and a leucine zipper motif in transmembrane domain III. Immunofluorescence experiments indicated that the 58-kD protein is localized to the cytoplasm. Using in vitro assays with semi-intact cells, Kanamori et al. (1997) demonstrated that the AT1 protein functioned as an acetyl-CoA transporter. Northern blot analysis revealed that AT1 was expressed as 3.3- and 4.3-kb mRNAs in all tissues tested. Kanamori et al. (1997) concluded that AT1 is an acetyl-CoA transporter that is involved in the process of O-acetylation. Bora et al. (1998) stated that nucleotide sequences of the mouse and human ACATN genes are 87% identical. By fluorescence in situ hybridization, Bora et al. (1998) mapped the Acatn gene to mouse chromosome 3E1-E3.

[88958] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[88959] Bora, R. S.; Kanamori, A.; Hirabayashi, Y. : Assignment of a putative acetyl-CoA transporter gene (Acatn) to mouse chromosome band 3E1-E3 by in situ hybridization. Cytogenet. Cell Genet. 83: 78-79, 1998. ; and

[88960] Kanamori, A.; Nakayama, J.; Fukuda, M. N.; Stallcup, W. B.;

Sasaki, K.; Fukuda, M.; Hirabayashi, Y. : Expression cloning and characterization of a cDNA encoding a novel membrane protein.

[88961] Further studies establishing the function and utilities of ACATN are found in John Hopkins OMIM database record ID 603690, and in sited publications numbered 493 and 4949 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056) is another VGAM2643 host target gene. CCND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND1 BINDING SITE, designated SEQ ID:27603, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88962] Another function of VGAM2643 is therefore inhibition of Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056), a gene which is involved in the control of cell cycle and is required for Schwann cell pro-

liferation to proceed normally during Wallerian degeneration. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND1. The function of CCND1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM220.CD4 Antigen (p55) (CD4, Accession NM_000616) is another VGAM2643 host target gene. CD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD4 BINDING SITE, designated SEQ ID:6219, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88963] Another function of VGAM2643 is therefore inhibition of CD4 Antigen (p55) (CD4, Accession NM_000616), a gene which is T-cell surface glycoprotein and has role in cell-cell interactions and may act in signal transduction. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with CD4. The function of CD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM_003887) is another VGAM2643 host target gene. DDEF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDEF2 BINDING SITE, designated SEQ ID:9970, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88964] Another function of VGAM2643 is therefore inhibition of Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM_003887), a gene which interacts with members of the Arf and Src family. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDEF2. The function of DDEF2 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM464.G Protein-coupled Receptor 87 (GPR87, Accession NM_023915) is another VGAM2643 host target gene. GPR87 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR87, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR87 BINDING SITE, designated SEQ ID:23388, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88965] Another function of VGAM2643 is therefore inhibition of G Protein-coupled Receptor 87 (GPR87, Accession NM_023915), a gene which plays a role in cell communication. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR87. The function of GPR87 has been established by previous studies. By batch EST database searching, Wittenberger et al. (2001) identified a cDNA encoding GPR87. The deduced 358-amino acid protein, which is 89% identical to the mouse protein, lacks a leader peptide but possesses a C-terminal PDZ domain-

binding site. Northern blot analysis revealed expression of a 1.6-kb GPR87 transcript in placenta, with weaker expression in thymus. Lee et al. (2001) identified GPR87, which they called GPR95, in a genomic database using sequences of related GPRs as query. They cloned partial GPR87 sequences from ESTs of a human testis library and a human bladder cell library. Analysis of overlapping regions confirmed identity. The deduced 358-amino acid protein shares highest identity (OMIM Ref. No. 51-62%) in the transmembrane regions with the UDP-glucose receptor, the platelet ADP receptor, P2Y12 (OMIM Ref. No. 600515), and GPR86 (OMIM Ref. No. 606380). Northern blot analysis detected a 1.8-kb transcript at high levels in prostate and at lower levels in uterus and testis. Little expression was detected in thymus, colon, small intestine, and peripheral blood leukocytes.

[88966] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[88967] Lee, D. K.; Nguyen, T.; Lynch, K. R.; Cheng, R.; Vanti, W. B.; Arkhitko, O.; Lewis, T.; Evans, J. F.; George, S. R.; O'Dowd, B. F. : Discovery and mapping of ten novel G protein-coupled receptor genes. Gene 275: 83-91, 2001. ;

and

[88968] Wittenberger, T.; Schaller, H. C.; Hellebrand, S. : An expressed sequence tag (EST) data mining strategy succeeding in the discovery of new G-protein coupled receptors. J. Molec. Biol.

[88969] Further studies establishing the function and utilities of GPR87 are found in John Hopkins OMIM database record ID 606379, and in sited publications numbered 10637 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Karyopherin Alpha 1 (importin alpha 5) (KPNA1, Accession XM_087256) is another VGAM2643 host target gene. KPNA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KPNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA1 BINDING SITE, designated SEQ ID:39151, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88970] Another function of VGAM2643 is therefore inhibition of Karyopherin Alpha 1 (importin alpha 5) (KPNA1, Accession XM_087256), a gene which promotes docking of import

substrates to the nuclear pore complex. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA1. The function of KPNA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859.Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162) is another VGAM2643 host target gene. NFATC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFATC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFATC1 BINDING SITE, designated SEQ ID:12817, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88971] Another function of VGAM2643 is therefore inhibition of Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162), a gene which regulates he activation,proliferation,differentiation and programmed death of

ymphoid and nonlymphoid cells. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFATC1. The function of NFATC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM123.RPP30 (Accession NM_006413) is another VGAM2643 host target gene. RPP30 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:13123, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88972] Another function of VGAM2643 is therefore inhibition of RPP30 (Accession NM_006413), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30. The function of RPP30 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM230.Spastic Ataxia of Charlevoix-Saguenay (sacsin) (SACS, Accession XM_170738) is another VGAM2643 host target gene. SACS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SACS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SACS BINDING SITE, designated SEQ ID:45497, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88973] Another function of VGAM2643 is therefore inhibition of Spastic Ataxia of Charlevoix-Saguenay (sacsin) (SACS, Accession XM_170738). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SACS. Ras Homolog Gene Family, Member U (ARHU, Accession NM_021205) is another VGAM2643 host target gene. ARHU BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ARHU BINDING SITE, designated SEQ ID:22182, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88974] Another function of VGAM2643 is therefore inhibition of Ras Homolog Gene Family, Member U (ARHU, Accession NM_021205). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHU. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM_004536) is another VGAM2643 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10888, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88975] Another function of VGAM2643 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM_004536). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with BIRC1. Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424) is another VGAM2643 host target gene. CECR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:18887, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88976] Another function of VGAM2643 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. FLJ14437 (Accession NM_032578) is another VGAM2643 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26312, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88977] Another function of VGAM2643 is therefore inhibition of FLJ14437 (Accession NM_032578). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. KIAA1940 (Accession XM_086981) is another VGAM2643 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:39011, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88978] Another function of VGAM2643 is therefore inhibition of KIAA1940 (Accession XM_086981). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. ODZ2 (Accession XM_047995) is another

VGAM2643 host target gene. ODZ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ODZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODZ2 BINDING SITE, designated SEQ ID:35096, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88979] Another function of VGAM2643 is therefore inhibition of ODZ2 (Accession XM_047995). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODZ2. Peptidylprolyl Isomerase (cyclophilin)-like 2 (PPIL2, Accession NM_014337) is another VGAM2643 host target gene. PPIL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:15651, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88980] Another function of VGAM2643 is therefore inhibition of Peptidylprolyl Isomerase (cyclophilin)-like 2 (PPIL2, Accession NM_014337). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2. LOC121441 (Accession XM_058561) is another VGAM2643 host target gene. LOC121441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121441 BINDING SITE, designated SEQ ID:36660, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88981] Another function of VGAM2643 is therefore inhibition of LOC121441 (Accession XM_058561). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121441. LOC145945 (Accession XM_096908) is another VGAM2643 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145945, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40631, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88982] Another function of VGAM2643 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC222008 (Accession XM_168361) is another VGAM2643 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45128, to the nucleotide sequence of VGAM2643 RNA, herein designated VGAM RNA, also designated SEQ ID:5354.

[88983] Another function of VGAM2643 is therefore inhibition of LOC222008 (Accession XM_168361). Accordingly, utilities of VGAM2643 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC222008. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2644 (VGAM2644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[88984] VGAM2644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2644 was detected is described hereinabove with reference to Figs. 1-8.

[88985] VGAM2644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[88986] VGAM2644 gene encodes a VGAM2644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2644 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2644 precursor RNA is desig-

nated SEQ ID:2630, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2630 is located at position 5711 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[88987] VGAM2644 precursor RNA folds onto itself, forming VGAM2644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[88988] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2644 folded precursor RNA into VGAM2644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2644 RNA is designated SEQ ID:5355, and is provided hereinbelow with reference to the sequence

listing part.

[88989] VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2644 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[88990] VGAM2644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2644 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2644 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[88991] The complementary binding of VGAM2644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2644 host target RNA into VGAM2644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[88992] It is appreciated that VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2644 host target genes. The mRNA of each one of this plurality of VGAM2644 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2644 RNA, herein designated VGAM

RNA, and which when bound by VGAM2644 RNA causes inhibition of translation of respective one or more VGAM2644 host target proteins.

[88993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2644 gene, herein designated VGAM GENE, on one or more VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[88994] It is yet further appreciated that a function of VGAM2644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2644 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2644 correlate with, and may be deduced from, the identity of the host target genes which VGAM2644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[88995] Nucleotide sequences of the VGAM2644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2644 are further described hereinbelow with reference to Table 1.

[88996] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2644 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[88997] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2644 gene, herein designated VGAM is

inhibition of expression of VGAM2644 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2644 correlate with, and may be deduced from, the identity of the target genes which VGAM2644 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[88998] Adenylate Kinase 3 (AK3, Accession NM_013410) is a VGAM2644 host target gene. AK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK3 BINDING SITE, designated SEQ ID:15072, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[88999] A function of VGAM2644 is therefore inhibition of Adenylate Kinase 3 (AK3, Accession NM_013410), a gene which Adenylate kinase 3; strongly similar to murine Ak4. Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK3. The function of AK3 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM135.ALEX3 (Accession NM_016607) is another VGAM2644 host target gene. ALEX3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ALEX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:18712, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89000] Another function of VGAM2644 is therefore inhibition of ALEX3 (Accession NM_016607). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3. EH-domain Containing 2 (EHD2, Accession NM_014601) is another VGAM2644 host target gene. EHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD2 BIND-

ING SITE, designated SEQ ID:15965, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89001] Another function of VGAM2644 is therefore inhibition of EH-domain Containing 2 (EHD2, Accession NM_014601). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2. Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 4 (LILRB4, Accession NM_006847) is another VGAM2644 host target gene. LILRB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LILRB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LILRB4 BINDING SITE, designated SEQ ID:13715, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89002] Another function of VGAM2644 is therefore inhibition of Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 4 (LILRB4, Accession NM_006847). Accordingly, utilities of VGAM2644 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRB4. Nuclear RNA Export Factor 2 (NXF2, Accession NM_022053) is another VGAM2644 host target gene. NXF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NXF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF2 BINDING SITE, designated SEQ ID:22589, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89003] Another function of VGAM2644 is therefore inhibition of Nuclear RNA Export Factor 2 (NXF2, Accession NM_022053), a gene which is involved in the export of mrna from the nucleus to the cytoplasm. Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF2. The function of NXF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595.Tumor Protein P53 Binding Protein, 2 (TP53BP2, Accession NM_005426) is another VGAM2644

host target gene. TP53BP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TP53BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53BP2 BINDING SITE, designated SEQ ID:11894, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89004] Another function of VGAM2644 is therefore inhibition of Tumor Protein P53 Binding Protein, 2 (TP53BP2, Accession NM_005426), a gene which bindes p53. enhances the trans-activation function of p53 and induces the expression of p21. Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53BP2. The function of TP53BP2 has been established by previous studies. By immunoblot analysis, Iwabuchi et al. (1998) showed that expression of TP53BP2 or TP53BP1 (OMIM Ref. No. 605230) enhances the trans-activation function of p53 and induces the expression of p21 (CDKN1A; 116899). Immunofluorescence microscopy demonstrated that TP53BP2 is present only in the cytoplasm, regardless of p53 expres-

sion. Western blot analysis of fractionated cells confirmed that whereas p53 is found in both nuclear and cytosolic fractions, TP53BP2 is found only in the cytosol. Samuels-Lev et al. (2001) determined that the ASPP proteins interact with p53 (OMIM Ref. No. 191170) and specifically enhance p53-induced apoptosis but not cell cycle arrest. Inhibition of endogenous ASPP function suppressed the apoptotic function of endogenous p53 in response to apoptotic stimuli. ASPPs enhanced the DNA binding and transactivation function of p53 on the promoters of proapoptotic genes in vivo. Two tumor-derived p53 mutants with reduced apoptotic function were defective in cooperating with ASPP in apoptosis induction. Expression of the ASPPs was frequently downregulated in human breast carcinomas expressing wildtype p53 but not in those expressing mutant p53. Samuels-Lev et al. (2001) concluded that ASPPs regulate the tumor suppression function of p53 in vivo.

[89005] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[89006] Iwabuchi, K.; Li, B.; Massa, H. F.; Trask, B. J.; Date, T.; Fields, S. : Stimulation of p53-mediated transcriptional

activation by the p53-binding proteins, 53BP1 and 53BP2. J. Biol. Chem. 273: 26061-26068, 1998. ; and

[89007] Samuels-Lev, Y.; O'Connor, D. J.; Bergamaschi, D.; Trigiante, G.; Hsieh, J.-K.; Zhong, S.; Campargue, I.; Naumovski, L.; Crook, T.; Lu, X. : ASPP proteins specifically stimulate the apoptot.

[89008] Further studies establishing the function and utilities of TP53BP2 are found in John Hopkins OMIM database record ID 602143, and in sited publications numbered 5969-5973 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Cysteine and Tyrosine-rich 1 (CYYR1, Accession NM_052954) is another VGAM2644 host target gene. CYYR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYYR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYYR1 BINDING SITE, designated SEQ ID:27511, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89009] Another function of VGAM2644 is therefore inhibition of Cysteine and Tyrosine-rich 1 (CYYR1, Accession

NM_052954). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYYR1. FLJ20507 (Accession XM_012558) is another VGAM2644 host target gene. FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2, designated SEQ ID:30221 and SEQ ID:19513 respectively, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89010] Another function of VGAM2644 is therefore inhibition of FLJ20507 (Accession XM_012558). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507. KIAA0247 (Accession NM_014734) is another VGAM2644 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16370, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89011] Another function of VGAM2644 is therefore inhibition of KIAA0247 (Accession NM_014734). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0453 (Accession XM_044546) is another VGAM2644 host target gene. KIAA0453 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0453 BINDING SITE, designated SEQ ID:34227, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89012] Another function of VGAM2644 is therefore inhibition of KIAA0453 (Accession XM_044546). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0453. KIAA0574 (Accession XM_045076) is another VGAM2644 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34345, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89013] Another function of VGAM2644 is therefore inhibition of KIAA0574 (Accession XM_045076). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0574. KIAA0711 (Accession NM_014867) is another VGAM2644 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16958, to the nucleotide sequence of VGAM2644 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5355.

[89014] Another function of VGAM2644 is therefore inhibition of KIAA0711 (Accession NM_014867). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. KIAA1786 (Accession XM_038436) is another VGAM2644 host target gene. KIAA1786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1786 BINDING SITE, designated SEQ ID:32843, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89015] Another function of VGAM2644 is therefore inhibition of KIAA1786 (Accession XM_038436). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1786. poly(A) Binding Protein, Cytoplasmic 5 (PABPC5, Accession NM_080832) is another VGAM2644 host target gene. PABPC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by PABPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC5 BINDING SITE, designated SEQ ID:28095, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89016] Another function of VGAM2644 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 5 (PABPC5, Accession NM_080832). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC5. PR Domain Containing 10 (PRDM10, Accession NM_020228) is another VGAM2644 host target gene. PRDM10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRDM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM10 BINDING SITE, designated SEQ ID:21494, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89017] Another function of VGAM2644 is therefore inhibition of

PR Domain Containing 10 (PRDM10, Accession NM_020228). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM10. PRO1617 (Accession NM_018587) is another VGAM2644 host target gene. PRO1617 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1617 BINDING SITE, designated SEQ ID:20663, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89018] Another function of VGAM2644 is therefore inhibition of PRO1617 (Accession NM_018587). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1617. Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_133177) is another VGAM2644 host target gene. PTPRU BINDING SITE1 through PTPRU BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRU, corre-

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRU BINDING SITE1 through PTPRU BINDING SITE3, designated SEQ ID:28400, SEQ ID:28405 and SEQ ID:12255 respectively, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89019] Another function of VGAM2644 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_133177). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRU. Ring Finger Protein 38 (RNF38, Accession NM_022781) is another VGAM2644 host target gene. RNF38 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF38 BINDING SITE, designated SEQ ID:23062, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89020] Another function of VGAM2644 is therefore inhibition of Ring Finger Protein 38 (RNF38, Accession NM_022781). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF38. LOC144347 (Accession XM_084832) is another VGAM2644 host target gene. LOC144347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144347 BINDING SITE, designated SEQ ID:37723, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89021] Another function of VGAM2644 is therefore inhibition of LOC144347 (Accession XM_084832). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144347. LOC148581 (Accession XM_086243) is another VGAM2644 host target gene. LOC148581 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148581, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148581 BINDING SITE, designated SEQ ID:38567, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89022] Another function of VGAM2644 is therefore inhibition of LOC148581 (Accession XM_086243). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148581. LOC197259 (Accession XM_113849) is another VGAM2644 host target gene. LOC197259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197259 BINDING SITE, designated SEQ ID:42470, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89023] Another function of VGAM2644 is therefore inhibition of LOC197259 (Accession XM_113849). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC197259. LOC93268 (Accession XM_050158) is another VGAM2644 host target gene. LOC93268 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93268 BINDING SITE, designated SEQ ID:35586, to the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, also designated SEQ ID:5355.

[89024] Another function of VGAM2644 is therefore inhibition of LOC93268 (Accession XM_050158). Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2645 (VGAM2645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89025] VGAM2645 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2645 was detected is described hereinabove with reference to Figs. 1-8.

[89026] VGAM2645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89027] VGAM2645 gene encodes a VGAM2645 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2645 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2645 precursor RNA is designated SEQ ID:2631, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2631 is located at position 2957 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[89028] VGAM2645 precursor RNA folds onto itself, forming VGAM2645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89029] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2645 folded precursor RNA into VGAM2645 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2645 RNA is designated SEQ ID:5356, and is provided hereinbelow with reference to the sequence listing part.

[89030] VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2645 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89031] VGAM2645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2645 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89032] The complementary binding of VGAM2645 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2645 host target RNA into VGAM2645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89033] It is appreciated that VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2645 host target genes. The mRNA of each one of this plurality of VGAM2645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2645 RNA, herein designated VGAM RNA, and which when bound by VGAM2645 RNA causes inhibition of translation of respective one or more VGAM2645 host target proteins.

[89034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2645 gene, herein designated VGAM GENE, on one or more VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89035] It is yet further appreciated that a function of VGAM2645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2645 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2645 correlate with, and may be deduced from, the identity of the host target genes which VGAM2645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89036] Nucleotide sequences of the VGAM2645 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2645 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2645 are further described hereinbelow with reference to Table 1.

[89037] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2645 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2645 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89038] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2645 gene, herein designated VGAM is inhibition of expression of VGAM2645 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2645 correlate with, and may be deduced from, the identity of the target genes which VGAM2645 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89039] Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM_000333) is a VGAM2645 host target gene. SCA7 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SCA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA7 BINDING SITE, designated SEQ ID:5885, to the nucleotide sequence of VGAM2645 RNA, herein designated VGAM RNA, also designated SEQ ID:5356.

[89040] A function of VGAM2645 is therefore inhibition of Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM_000333). Accordingly, utilities of VGAM2645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA7. KIAA1028 (Accession XM_166324) is another VGAM2645 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44156, to the nucleotide sequence of VGAM2645 RNA, herein designated VGAM RNA, also designated SEQ

ID:5356.

[89041] Another function of VGAM2645 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM2645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. LOC148254 (Accession XM_086121) is another VGAM2645 host target gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38500, to the nucleotide sequence of VGAM2645 RNA, herein designated VGAM RNA, also designated SEQ ID:5356.

[89042] Another function of VGAM2645 is therefore inhibition of LOC148254 (Accession XM_086121). Accordingly, utilities of VGAM2645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. LOC256306 (Accession XM_172976) is another VGAM2645 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256306, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256306 BINDING SITE, designated SEQ ID:46234, to the nucleotide sequence of VGAM2645 RNA, herein designated VGAM RNA, also designated SEQ ID:5356.

[89043] Another function of VGAM2645 is therefore inhibition of LOC256306 (Accession XM_172976). Accordingly, utilities of VGAM2645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2646 (VGAM2646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89044] VGAM2646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2646 was detected is described hereinabove with reference to Figs. 1-8.

[89045] VGAM2646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne

Mosaic Virus. VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89046] VGAM2646 gene encodes a VGAM2646 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2646 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2646 precursor RNA is designated SEQ ID:2632, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2632 is located at position 1728 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[89047] VGAM2646 precursor RNA folds onto itself, forming VGAM2646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89048] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2646 folded precursor RNA into VGAM2646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2646 RNA is designated SEQ ID:5357, and is provided hereinbelow with reference to the sequence listing part.

[89049] VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2646 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89050] VGAM2646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2646 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89051] The complementary binding of VGAM2646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2646 host target RNA into VGAM2646 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89052] It is appreciated that VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2646 host target genes. The mRNA of each one of this plurality of VGAM2646 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2646 RNA, herein designated VGAM RNA, and which when bound by VGAM2646 RNA causes inhibition of translation of respective one or more VGAM2646 host target proteins.

[89053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2646 gene, herein designated VGAM GENE, on one or more VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89054] It is yet further appreciated that a function of VGAM2646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2646 correlate with, and may be deduced from, the identity of the host target genes which VGAM2646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89055] Nucleotide sequences of the VGAM2646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2646 are further described hereinbelow with reference to Table 1.

[89056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2646 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2646 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89057] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2646 gene, herein designated VGAM is inhibition of expression of VGAM2646 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2646 correlate with, and may be deduced from, the identity of the target genes which VGAM2646 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89058] Astrotactin (ASTN, Accession XM_045113) is a VGAM2646 host target gene. ASTN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ASTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASTN BINDING SITE, designated SEQ ID:34362, to the nucleotide sequence of

VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89059] A function of VGAM2646 is therefore inhibition of Astrotactin (ASTN, Accession XM_045113). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASTN. UDP-
N-
acetyl-al-
pha-
D-galac-
tosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478) is another VGAM2646 host target gene. GALGT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GALGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALGT BINDING SITE, designated SEQ ID:7213, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89060] Another function of VGAM2646 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478), a gene which is involved in the biosynthesis of gangliosides gm2, gd2 and ga2. Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALGT. The function of GALGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.KIAA0442 (Accession NM_015570) is another VGAM2646 host target gene. KIAA0442 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0442 BINDING SITE, designated SEQ

ID:17841, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89061] Another function of VGAM2646 is therefore inhibition of KIAA0442 (Accession NM_015570). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0442. Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767) is another VGAM2646 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13639, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89062] Another function of VGAM2646 is therefore inhibition of Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1.

Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620) is another VGAM2646 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6232, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89063] Another function of VGAM2646 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions throughout the body. Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM2646 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26797 and SEQ ID:26812 respectively, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89064] Another function of VGAM2646 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.SMAC (Accession NM_138930) is another VGAM2646 host target gene. SMAC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by SMAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:29048, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89065] Another function of VGAM2646 is therefore inhibition of SMAC (Accession NM_138930), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.UV Radiation Resistance Associated Gene (UVRAG, Accession NM_003369) is another VGAM2646 host target gene. UVRAG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UVRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UVRAG BINDING SITE, des-

ignated SEQ ID:9395, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89066] Another function of VGAM2646 is therefore inhibition of UV Radiation Resistance Associated Gene (UVRAG, Accession NM_003369). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UVRAG. A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816) is another VGAM2646 host target gene. ADAM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM9 BINDING SITE, designated SEQ ID:9907, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89067] Another function of VGAM2646 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816). Accordingly, utilities of VGAM2646 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ADAM9. Adaptor-related Protein Complex 3, Mu 1 Subunit (AP3M1, Accession NM_012095) is another VGAM2646 host target gene. AP3M1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP3M1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M1 BINDING SITE, designated SEQ ID:14396, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89068] Another function of VGAM2646 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 1 Subunit (AP3M1, Accession NM_012095). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M1. Aquaporin 10 (AQP10, Accession NM_080429) is another VGAM2646 host target gene. AQP10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AQP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of AQP10 BINDING SITE, designated SEQ ID:27841, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89069] Another function of VGAM2646 is therefore inhibition of Aquaporin 10 (AQP10, Accession NM_080429). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP10. CDT1 (Accession XM_085327) is another VGAM2646 host target gene. CDT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT1 BINDING SITE, designated SEQ ID:38070, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89070] Another function of VGAM2646 is therefore inhibition of CDT1 (Accession XM_085327). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT1. Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession

NM_014918) is another VGAM2646 host target gene. CHSY1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHSY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:17172, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89071] Another function of VGAM2646 is therefore inhibition of Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM_014918). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1. DKFZp434E2220 (Accession NM_017612) is another VGAM2646 host target gene. DKFZp434E2220 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:19113, to the nucleotide

sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89072] Another function of VGAM2646 is therefore inhibition of DKFZp434E2220 (Accession NM_017612). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220. DKFZP434L1435 (Accession XM_166401) is another VGAM2646 host target gene. DKFZP434L1435 BINDING SITE1 through DKFZP434L1435 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434L1435, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L1435 BINDING SITE1 through DKFZP434L1435 BINDING SITE3, designated SEQ ID:44265, SEQ ID:46701 and SEQ ID:46663 respectively, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89073] Another function of VGAM2646 is therefore inhibition of DKFZP434L1435 (Accession XM_166401). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434L1435. FLJ13195 (Accession NM_022906) is another VGAM2646 host target gene. FLJ13195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13195 BINDING SITE, designated SEQ ID:23204, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89074] Another function of VGAM2646 is therefore inhibition of FLJ13195 (Accession NM_022906). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13195. FLJ14547 (Accession NM_032804) is another VGAM2646 host target gene. FLJ14547 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14547 BINDING SITE, designated SEQ ID:26560, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM

RNA, also designated SEQ ID:5357.

[89075] Another function of VGAM2646 is therefore inhibition of FLJ14547 (Accession NM_032804). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14547. FLJ20079 (Accession NM_017656) is another VGAM2646 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19166, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89076] Another function of VGAM2646 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ20342 (Accession NM_017774) is another VGAM2646 host target gene. FLJ20342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20342, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20342 BINDING SITE, designated SEQ ID:19397, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89077] Another function of VGAM2646 is therefore inhibition of FLJ20342 (Accession NM_017774). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20342. FLJ20519 (Accession NM_017860) is another VGAM2646 host target gene. FLJ20519 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20519 BINDING SITE, designated SEQ ID:19538, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89078] Another function of VGAM2646 is therefore inhibition of FLJ20519 (Accession NM_017860). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20519. FLJ22169 (Accession NM_024085) is another VGAM2646 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23526, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89079] Another function of VGAM2646 is therefore inhibition of FLJ22169 (Accession NM_024085). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. KIAA0561 (Accession XM_038150) is another VGAM2646 host target gene. KIAA0561 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32768, to the

nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89080] Another function of VGAM2646 is therefore inhibition of KIAA0561 (Accession XM_038150). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561. KIAA0779 (Accession XM_098229) is another VGAM2646 host target gene. KIAA0779 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0779 BINDING SITE, designated SEQ ID:41502, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89081] Another function of VGAM2646 is therefore inhibition of KIAA0779 (Accession XM_098229). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0779. KIAA1396 (Accession XM_032054) is another VGAM2646 host target gene. KIAA1396 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:31544, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89082] Another function of VGAM2646 is therefore inhibition of KIAA1396 (Accession XM_032054). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396. KIAA1553 (Accession XM_166320) is another VGAM2646 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:44140, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89083] Another function of VGAM2646 is therefore inhibition of KIAA1553 (Accession XM_166320). Accordingly, utilities

of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. KIAA1602 (Accession XM_035497) is another VGAM2646 host target gene. KIAA1602 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1602 BINDING SITE, designated SEQ ID:32276, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89084] Another function of VGAM2646 is therefore inhibition of KIAA1602 (Accession XM_035497). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1602. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM2646 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of LASP1 BINDING SITE, designated SEQ ID:12805, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89085] Another function of VGAM2646 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM_033392) is another VGAM2646 host target gene. MAPK8IP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK8IP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP3 BINDING SITE, designated SEQ ID:27217, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89086] Another function of VGAM2646 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM_033392). Accordingly, utilities

of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP3. Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438) is another VGAM2646 host target gene. NUDT12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUDT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT12 BINDING SITE, designated SEQ ID:25446, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89087] Another function of VGAM2646 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT12. Paired Mesoderm Homeobox 2b (PMX2B, Accession NM_003924) is another VGAM2646 host target gene. PMX2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PMX2B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX2B BINDING SITE, designated SEQ ID:10014, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89088] Another function of VGAM2646 is therefore inhibition of Paired Mesoderm Homeobox 2b (PMX2B, Accession NM_003924). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX2B. PRO2389 (Accession XM_033334) is another VGAM2646 host target gene. PRO2389 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2389 BINDING SITE, designated SEQ ID:31879, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89089] Another function of VGAM2646 is therefore inhibition of PRO2389 (Accession XM_033334). Accordingly, utilities of

VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2389. SIMRP7 (Accession XM_166462) is another VGAM2646 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44369, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89090] Another function of VGAM2646 is therefore inhibition of SIMRP7 (Accession XM_166462). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. TCF-3 (Accession NM_031283) is another VGAM2646 host target gene. TCF-3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF-3 BINDING SITE, designated SEQ

ID:25307, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89091] Another function of VGAM2646 is therefore inhibition of TCF-3 (Accession NM_031283). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF-3. TUBB5 (Accession NM_006087) is another VGAM2646 host target gene. TUBB5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUBB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUBB5 BINDING SITE, designated SEQ ID:12732, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89092] Another function of VGAM2646 is therefore inhibition of TUBB5 (Accession NM_006087). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBB5. Zinc Finger Protein 31 (KOX 29) (ZNF31, Accession XM_036305) is another VGAM2646 host target gene.

ZNF31 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF31 BINDING SITE, designated SEQ ID:32421, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89093] Another function of VGAM2646 is therefore inhibition of Zinc Finger Protein 31 (KOX 29) (ZNF31, Accession XM_036305). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF31. Zinc Finger Protein 317 (ZNF317, Accession XM_050435) is another VGAM2646 host target gene. ZNF317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF317 BINDING SITE, designated SEQ ID:35634, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM

RNA, also designated SEQ ID:5357.

[89094] Another function of VGAM2646 is therefore inhibition of Zinc Finger Protein 317 (ZNF317, Accession XM_050435). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF317. LOC130644 (Accession XM_065813) is another VGAM2646 host target gene. LOC130644 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130644 BINDING SITE, designated SEQ ID:37302, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89095] Another function of VGAM2646 is therefore inhibition of LOC130644 (Accession XM_065813). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130644. LOC149650 (Accession XM_086623) is another VGAM2646 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38798, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89096] Another function of VGAM2646 is therefore inhibition of LOC149650 (Accession XM_086623). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. LOC150776 (Accession XM_032542) is another VGAM2646 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31674, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89097] Another function of VGAM2646 is therefore inhibition of LOC150776 (Accession XM_032542). Accordingly, utilities

of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. LOC256158 (Accession XM_175125) is another VGAM2646 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46630, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89098] Another function of VGAM2646 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC90841 (Accession XM_034427) is another VGAM2646 host target gene. LOC90841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90841 BINDING SITE, designated SEQ ID:32112, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89099] Another function of VGAM2646 is therefore inhibition of LOC90841 (Accession XM_034427). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841. LOC92609 (Accession XM_053074) is another VGAM2646 host target gene. LOC92609 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92609 BINDING SITE, designated SEQ ID:36060, to the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, also designated SEQ ID:5357.

[89100] Another function of VGAM2646 is therefore inhibition of LOC92609 (Accession XM_053074). Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2647 (VGAM2647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89101] VGAM2647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2647 was detected is described hereinabove with reference to Figs. 1-8.

[89102] VGAM2647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89103] VGAM2647 gene encodes a VGAM2647 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2647 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2647 precursor RNA is designated SEQ ID:2633, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2633 is located at position 7881 relative to the

genome of Cowpea Aphid-borne Mosaic Virus.

[89104] VGAM2647 precursor RNA folds onto itself, forming VGAM2647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89105] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2647 folded precursor RNA into VGAM2647 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2647 RNA is designated SEQ ID:5358, and is provided hereinbelow with reference to the sequence listing part.

[89106] VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2647 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89107] VGAM2647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2647 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89108] The complementary binding of VGAM2647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2647 host target RNA into VGAM2647 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89109] It is appreciated that VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2647 host target genes. The mRNA of each one of this plurality of VGAM2647 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2647 RNA, herein designated VGAM RNA, and which when bound by VGAM2647 RNA causes inhibition of translation of respective one or more VGAM2647 host target proteins.

[89110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2647 gene, herein designated VGAM GENE, on one or more VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89111] It is yet further appreciated that a function of VGAM2647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2647 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of

VGAM2647 correlate with, and may be deduced from, the identity of the host target genes which VGAM2647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89112] Nucleotide sequences of the VGAM2647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2647 are further described hereinbelow with reference to Table 1.

[89113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2647 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89114] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2647 gene, herein designated VGAM is inhibition of expression of VGAM2647 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2647 correlate with, and may be deduced

from, the identity of the target genes which VGAM2647 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89115] Nebulin-related Anchoring Protein (NRAP, Accession NM_006175) is a VGAM2647 host target gene. NRAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRAP BINDING SITE, designated SEQ ID:12832, to the nucleotide sequence of VGAM2647 RNA, herein designated VGAM RNA, also designated SEQ ID:5358.

[89116] A function of VGAM2647 is therefore inhibition of Nebulin-related Anchoring Protein (NRAP, Accession NM_006175), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to protein complexes located beneath the sarcolemma. Accordingly, utilities of VGAM2647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRAP. The function of NRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM649.LOC115294 (Accession XM_054302) is another VGAM2647 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36144, to the nucleotide sequence of VGAM2647 RNA, herein designated VGAM RNA, also designated SEQ ID:5358.

[89117] Another function of VGAM2647 is therefore inhibition of LOC115294 (Accession XM_054302). Accordingly, utilities of VGAM2647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2648 (VGAM2648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89118] VGAM2648 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2648 was detected is described hereinabove with reference to Figs. 1-8.

[89119] VGAM2648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89120] VGAM2648 gene encodes a VGAM2648 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2648 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2648 precursor RNA is designated SEQ ID:2634, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2634 is located at position 7656 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[89121] VGAM2648 precursor RNA folds onto itself, forming VGAM2648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89122] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2648 folded precursor RNA into VGAM2648 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2648 RNA is designated SEQ ID:5359, and is provided hereinbelow with reference to the sequence listing part.

[89123] VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2648 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89124] VGAM2648 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2648 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89125] The complementary binding of VGAM2648 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2648 host target RNA into VGAM2648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89126] It is appreciated that VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2648 host target genes. The mRNA of each one of this plurality of VGAM2648 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2648 RNA, herein designated VGAM RNA, and which when bound by VGAM2648 RNA causes inhibition of translation of respective one or more VGAM2648 host target proteins.

[89127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2648 gene, herein designated VGAM GENE, on one or more VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89128] It is yet further appreciated that a function of VGAM2648 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2648 correlate with, and may be deduced from, the identity of the host target genes which VGAM2648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89129] Nucleotide sequences of the VGAM2648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2648 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2648 are further described hereinbelow with reference to Table 1.

[89130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2648 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2648 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89131] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2648 gene, herein designated VGAM is inhibition of expression of VGAM2648 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2648 correlate with, and may be deduced from, the identity of the target genes which VGAM2648 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89132] Prominin-like 1 (mouse) (PROML1, Accession NM_006017) is a VGAM2648 host target gene. PROML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PROML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROML1 BINDING SITE, designated SEQ ID:12633, to the nucleotide sequence of VGAM2648 RNA, herein designated VGAM RNA, also designated SEQ ID:5359.

[89133] A function of VGAM2648 is therefore inhibition of Prominin-like 1 (mouse) (PROML1, Accession NM_006017), a gene which is a Transmembrane protein. Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROML1. The function of PROML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM905.FLJ13052 (Accession NM_023018) is another VGAM2648 host target gene. FLJ13052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13052 BINDING SITE, designated SEQ

ID:23282, to the nucleotide sequence of VGAM2648 RNA, herein designated VGAM RNA, also designated SEQ ID:5359.

[89134] Another function of VGAM2648 is therefore inhibition of FLJ13052 (Accession NM_023018). Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13052. HSPC063 (Accession NM_014155) is another VGAM2648 host target gene. HSPC063 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPC063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC063 BINDING SITE, designated SEQ ID:15439, to the nucleotide sequence of VGAM2648 RNA, herein designated VGAM RNA, also designated SEQ ID:5359.

[89135] Another function of VGAM2648 is therefore inhibition of HSPC063 (Accession NM_014155). Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC063. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM_002816) is an-

other VGAM2648 host target gene. PSMD12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSMD12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD12 BINDING SITE, designated SEQ ID:8683, to the nucleotide sequence of VGAM2648 RNA, herein designated VGAM RNA, also designated SEQ ID:5359.

[89136] Another function of VGAM2648 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM_002816). Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD12. LOC158055 (Accession XM_088453) is another VGAM2648 host target gene. LOC158055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158055 BINDING SITE, designated SEQ ID:39702, to the nucleotide sequence of VGAM2648 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5359.

[89137] Another function of VGAM2648 is therefore inhibition of LOC158055 (Accession XM_088453). Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158055. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2649 (VGAM2649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89138] VGAM2649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2649 was detected is described hereinabove with reference to Figs. 1-8.

[89139] VGAM2649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89140] VGAM2649 gene encodes a VGAM2649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2649 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2649 precursor RNA is designated SEQ ID:2635, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2635 is located at position 2803 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[89141] VGAM2649 precursor RNA folds onto itself, forming VGAM2649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89142] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2649 folded precursor RNA into VGAM2649 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2649 RNA is designated SEQ ID:5360, and is provided hereinbelow with reference to the sequence listing part.

[89143] VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2649 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89144] VGAM2649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2649 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2649 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89145] The complementary binding of VGAM2649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2649 host target RNA into VGAM2649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89146] It is appreciated that VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2649 host target genes. The mRNA of

each one of this plurality of VGAM2649 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2649 RNA, herein designated VGAM RNA, and which when bound by VGAM2649 RNA causes inhibition of translation of respective one or more VGAM2649 host target proteins.

[89147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2649 gene, herein designated VGAM GENE, on one or more VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[89148] It is yet further appreciated that a function of VGAM2649 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2649 correlate with, and may be deduced from, the identity of the host target genes which VGAM2649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89149] Nucleotide sequences of the VGAM2649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2649 are further described hereinbelow with reference to Table 1.

[89150] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2649 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2649 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89151] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2649 gene, herein designated VGAM is inhibition of expression of VGAM2649 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2649 correlate with, and may be deduced from, the identity of the target genes which VGAM2649 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89152] Protein Kinase C, Beta 1 (PRKCB1, Accession XM_047187) is a VGAM2649 host target gene. PRKCB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCB1 BINDING SITE, designated SEQ ID:34902, to the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89153] A function of VGAM2649 is therefore inhibition of Protein Kinase C, Beta 1 (PRKCB1, Accession XM_047187), a gene which is a calcium-activated, phospholipid-dependent,

serine- and threonine-specific enzyme. Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCB1. The function of PRKCB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2065.Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517) is another VGAM2649 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13273, to the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89154] Another function of VGAM2649 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517). Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SLC16A2. MGC4415 (Accession NM_031484) is another VGAM2649 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25573, to the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89155] Another function of VGAM2649 is therefore inhibition of MGC4415 (Accession NM_031484). Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. LOC126669 (Accession XM_060121) is another VGAM2649 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37161, to

the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89156] Another function of VGAM2649 is therefore inhibition of LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC195977 (Accession XM_113625) is another VGAM2649 host target gene. LOC195977 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC195977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC195977 BINDING SITE, designated SEQ ID:42299, to the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89157] Another function of VGAM2649 is therefore inhibition of LOC195977 (Accession XM_113625). Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC195977. LOC51026 (Accession NM_016072) is another VGAM2649 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC51026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:18143, to the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89158] Another function of VGAM2649 is therefore inhibition of LOC51026 (Accession NM_016072). Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51026. LOC91565 (Accession XM_039231) is another VGAM2649 host target gene. LOC91565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE, designated SEQ ID:33025, to the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, also designated SEQ ID:5360.

[89159] Another function of VGAM2649 is therefore inhibition of LOC91565 (Accession XM_039231). Accordingly, utilities

of VGAM2649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2650 (VGAM2650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89160] VGAM2650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2650 was detected is described hereinabove with reference to Figs. 1-8.

[89161] VGAM2650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichomonas Vaginalis Virus 3. VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89162] VGAM2650 gene encodes a VGAM2650 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2650 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2650 precursor RNA is designated SEQ ID:2636, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2636 is located at position 2782 relative to the genome of Trichomonas Vaginalis Virus 3.

[89163] VGAM2650 precursor RNA folds onto itself, forming VGAM2650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89164] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2650 folded precursor RNA into VGAM2650 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2650 RNA is designated SEQ ID:5361, and

is provided hereinbelow with reference to the sequence listing part.

[89165] VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2650 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89166] VGAM2650 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2650 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2650 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89167] The complementary binding of VGAM2650 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2650 host target RNA into VGAM2650 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89168] It is appreciated that VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2650 host target genes. The mRNA of each one of this plurality of VGAM2650 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2650 RNA, herein designated VGAM RNA, and which when bound by VGAM2650 RNA causes inhibition of translation of respective one or more VGAM2650 host target proteins.

[89169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2650 gene, herein designated VGAM GENE, on one or more VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89170] It is yet further appreciated that a function of VGAM2650 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2650 include diagnosis, prevention and treatment of viral infection by Trichomonas Vaginalis Virus 3. Specific functions, and accordingly utilities, of VGAM2650 correlate with, and may be deduced from, the identity of the host target genes which VGAM2650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89171] Nucleotide sequences of the VGAM2650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2650 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2650 are further described hereinbelow with reference to Table 1.

[89172] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2650 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89173] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2650 gene, herein designated VGAM is inhibition of expression of VGAM2650 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2650 correlate with, and may be deduced from, the identity of the target genes which VGAM2650 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89174] MGC10960 (Accession NM_032653) is a VGAM2650 host target gene. MGC10960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10960 BINDING SITE, designated SEQ ID:26386, to the nucleotide sequence of VGAM2650 RNA, herein designated VGAM RNA, also designated SEQ ID:5361.

[89175] A function of VGAM2650 is therefore inhibition of MGC10960 (Accession NM_032653). Accordingly, utilities of VGAM2650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10960. LOC220514 (Accession XM_017498) is another VGAM2650 host target gene. LOC220514 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220514 BINDING SITE, designated SEQ ID:30324, to the nucleotide sequence of VGAM2650 RNA, herein designated VGAM RNA, also designated SEQ ID:5361.

[89176] Another function of VGAM2650 is therefore inhibition of LOC220514 (Accession XM_017498). Accordingly, utilities of VGAM2650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220514. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2651 (VGAM2651) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89177] VGAM2651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2651 was detected is described hereinabove with reference to Figs. 1-8.

[89178] VGAM2651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichomonas Vaginalis Virus 3. VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89179] VGAM2651 gene encodes a VGAM2651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2651 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2651 precursor RNA is designated SEQ ID:2637, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2637 is located at position 3926 relative to the genome of Trichomonas Vaginalis Virus 3.

[89180] VGAM2651 precursor RNA folds onto itself, forming VGAM2651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[89181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2651 folded precursor RNA into VGAM2651 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2651 RNA is designated SEQ ID:5362, and is provided hereinbelow with reference to the sequence listing part.

[89182] VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2651 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89183] VGAM2651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2651 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2651 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2651 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89184] The complementary binding of VGAM2651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2651 host target RNA into VGAM2651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89185] It is appreciated that VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2651 host target genes. The mRNA of each one of this plurality of VGAM2651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2651 RNA, herein designated VGAM RNA, and which when bound by VGAM2651 RNA causes inhibition of translation of respective one or more VGAM2651 host target proteins.

[89186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2651 gene, herein designated VGAM GENE, on one or more VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89187] It is yet further appreciated that a function of VGAM2651 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of viral infection by Trichomonas Vaginalis Virus 3. Specific functions, and accordingly utilities, of VGAM2651 correlate with, and may be deduced from, the identity of the host target genes which VGAM2651 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89188] Nucleotide sequences of the VGAM2651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2651 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2651 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2651 are further described hereinbelow with reference to Table 1.

[89189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2651 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89190] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2651 gene, herein designated VGAM is inhibition of expression of VGAM2651 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2651 correlate with, and may be deduced from, the identity of the target genes which VGAM2651 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89191] Adducin 2 (beta) (ADD2, Accession NM_017485) is a VGAM2651 host target gene. ADD2 BINDING SITE1 through ADD2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE1 through ADD2 BINDING SITE4, designated SEQ ID:18942, SEQ ID:18945, SEQ ID:18950 and SEQ ID:18937 respectively, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89192] A function of VGAM2651 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NM_017485), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2. The function of ADD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1185.Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, S. cerevisiae) (ATRX, Accession NM_000489) is another VGAM2651 host target gene. ATRX BINDING SITE1 and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:6099 and SEQ ID:8609 respectively, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89193] Another function of VGAM2651 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, S. cerevisiae) (ATRX, Accession NM_000489). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. DKFZP434L187 (Accession XM_044070) is another VGAM2651 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34128, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89194] Another function of VGAM2651 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, util-

ities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ11506 (Accession NM_024666) is another VGAM2651 host target gene. FLJ11506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11506 BINDING SITE, designated SEQ ID:23970, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89195] Another function of VGAM2651 is therefore inhibition of FLJ11506 (Accession NM_024666). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11506. FLJ23878 (Accession NM_144990) is another VGAM2651 host target gene. FLJ23878 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23878

BINDING SITE, designated SEQ ID:29593, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89196] Another function of VGAM2651 is therefore inhibition of FLJ23878 (Accession NM_144990). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23878. KIAA0649 (Accession NM_014811) is another VGAM2651 host target gene. KIAA0649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0649 BINDING SITE, designated SEQ ID:16775, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89197] Another function of VGAM2651 is therefore inhibition of KIAA0649 (Accession NM_014811). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0649. KIAA1238 (Accession XM_048675) is another VGAM2651 host target gene. KIAA1238 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1238 BINDING SITE, designated SEQ ID:35217, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89198] Another function of VGAM2651 is therefore inhibition of KIAA1238 (Accession XM_048675). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1238. Zinc Finger Protein 84 (HPF2) (ZNF84, Accession NM_003428) is another VGAM2651 host target gene. ZNF84 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF84, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF84 BINDING SITE, designated SEQ ID:9480, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89199] Another function of VGAM2651 is therefore inhibition of

Zinc Finger Protein 84 (HPF2) (ZNF84, Accession NM_003428). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF84. LOC152328 (Accession XM_087420) is another VGAM2651 host target gene. LOC152328 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152328 BINDING SITE, designated SEQ ID:39244, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89200] Another function of VGAM2651 is therefore inhibition of LOC152328 (Accession XM_087420). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152328. LOC255533 (Accession XM_173073) is another VGAM2651 host target gene. LOC255533 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255533, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255533 BINDING SITE, designated SEQ ID:46333, to the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, also designated SEQ ID:5362.

[89201] Another function of VGAM2651 is therefore inhibition of LOC255533 (Accession XM_173073). Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255533. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2652 (VGAM2652) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89202] VGAM2652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2652 was detected is described hereinabove with reference to Figs. 1-8.

[89203] VGAM2652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum Mosaic Virus. VGAM2652 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[89204] VGAM2652 gene encodes a VGAM2652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2652 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2652 precursor RNA is designated SEQ ID:2638, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2638 is located at position 6180 relative to the genome of Sorghum Mosaic Virus.

[89205] VGAM2652 precursor RNA folds onto itself, forming VGAM2652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89206] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2652 folded precursor RNA into VGAM2652

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2652 RNA is designated SEQ ID:5363, and is provided hereinbelow with reference to the sequence listing part.

[89207] VGAM2652 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2652 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89208] VGAM2652 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2652 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2652 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89209] The complementary binding of VGAM2652 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2652 host target RNA into VGAM2652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[89210] It is appreciated that VGAM2652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2652 host target genes. The mRNA of each one of this plurality of VGAM2652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2652 RNA, herein designated VGAM RNA, and which when bound by VGAM2652 RNA causes inhibition of translation of respective one or more VGAM2652 host target proteins.

[89211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2652 gene, herein designated VGAM GENE, on one or more VGAM2652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89212] It is yet further appreciated that a function of VGAM2652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of viral infection by Sorghum Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2652 correlate with, and may be deduced from, the identity of the host target genes which VGAM2652 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89213] Nucleotide sequences of the VGAM2652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2652 are further described hereinbelow with reference to Table 1.

[89214] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2652 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89215] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2652 gene, herein designated VGAM is inhibition of expression of VGAM2652 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2652 correlate with, and may be deduced from, the identity of the target genes which VGAM2652 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89216] Alpha-1-B Glycoprotein (A1BG, Accession NM_130786) is a VGAM2652 host target gene. A1BG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by A1BG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE, designated SEQ ID:28278, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA,

also designated SEQ ID:5363.

[89217] A function of VGAM2652 is therefore inhibition of Alpha-1-B Glycoprotein (A1BG, Accession NM_130786), a gene which a plasma protein of unknown function. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG. The function of A1BG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM_005099) is another VGAM2652 host target gene. ADAMTS4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAMTS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS4 BINDING SITE, designated SEQ ID:11570, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89218] Another function of VGAM2652 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with

Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM_005099), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS4. The function of ADAMTS4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM809.Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is another VGAM2652 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7334, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89219] Another function of VGAM2652 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing en-

zymes. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM368.ATPase, H+ Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM_001690) is another VGAM2652 host target gene. ATP6V1A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP6V1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1A1 BINDING SITE, designated SEQ ID:7410, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89220] Another function of VGAM2652 is therefore inhibition of ATPase, H+ Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM_001690), a gene which is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ATP6V1A1. The function of ATP6V1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.BRIP1 (Accession NM_032043) is another VGAM2652 host target gene. BRIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRIP1 BINDING SITE, designated SEQ ID:25756, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89221] Another function of VGAM2652 is therefore inhibition of BRIP1 (Accession NM_032043). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1. Cholinergic Receptor, Nicotinic, Beta Polypeptide 4 (CHRNB4, Accession NM_000750) is another VGAM2652 host target gene. CHRNB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHRNB4, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNB4 BINDING SITE, designated SEQ ID:6404, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89222] Another function of VGAM2652 is therefore inhibition of Cholinergic Receptor, Nicotinic, Beta Polypeptide 4 (CHRNB4, Accession NM_000750), a gene which mediates fast signal transmission at synapses. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNB4. The function of CHRNB4 has been established by previous studies. Transmitter-gated cation channels are detectors of excitatory chemical signals at synapses in the nervous system. Khakh et al. (2000) showed that structurally distinct alpha-3-beta-4 nicotinic and P2X(2) (OMIM Ref. No. 600844) channels influence each other when coactivated. The activation of one channel type affects distinct kinetic and conductance states of the other, and coactivation results in nonadditive responses owing to inhibition of both channel types. State-dependent inhibition of nicotinic channels was revealed most clearly with mu-

tant P2X(2) channels, and inhibition was decreased at lower densities of channel expression. In synaptically coupled myenteric neurons, nicotinic fast excitatory postsynaptic currents were occluded during activation of endogenously coexpressed P2X channels. Khakh et al. (2000) concluded that their data provide a molecular basis and a synaptic context for cross-inhibition between transmitter-gated channels. Transmitter-gated cation channels are detectors of excitatory chemical signals at synapses in the nervous system. Khakh et al. (2000) showed that structurally distinct alpha-3-beta-4 nicotinic and P2X(2) (OMIM Ref. No. 600844) channels influence each other when coactivated. The activation of one channel type affects distinct kinetic and conductance states of the other, and coactivation results in nonadditive responses owing to inhibition of both channel types. State-dependent inhibition of nicotinic channels was revealed most clearly with mutant P2X(2) channels, and inhibition was decreased at lower densities of channel expression. In synaptically coupled myenteric neurons, nicotinic fast excitatory postsynaptic currents were occluded during activation of endogenously coexpressed P2X channels. Khakh et al. (2000) concluded that their data provide a molecular basis

and a synaptic context for cross-inhibition between transmitter-gated channels

[89223] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[89224] Khakh, B. S.; Zhou, X.; Sydes, J.; Galligan, J. J.; Lester, H. A. : State-dependent cross-inhibition between transmitter-gated cation channels. Nature 406: 405-410, 2000. ; and

[89225] Tarroni, P.; Rubboli, F.; Chini, B.; Zwart, R.; Oortgiesen, M.; Sher, E.; Clementi, F. : Neuronal-type nicotinic receptors in human neuroblastoma and small-cell lung carcinoma cell line.

[89226] Further studies establishing the function and utilities of CHRNB4 are found in John Hopkins OMIM database record ID 118509, and in sited publications numbered 33, 390, 9944, 1268 and 12696 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470) is another VGAM2652 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27793, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89227] Another function of VGAM2652 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Cytochrome P450, Subfamily IIB (phenobarbital-inducible), Polypeptide 6 (CYP2B6, Accession NM_000767) is another VGAM2652 host target gene. CYP2B6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP2B6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP2B6 BINDING SITE, designated SEQ ID:6415, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89228] Another function of VGAM2652 is therefore inhibition of

Cytochrome P450, Subfamily IIB (phenobarbital-inducible), Polypeptide 6 (CYP2B6, Accession NM_000767), a gene which oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, and xenobiotics. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2B6. The function of CYP2B6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Fc Fragment of IgA, Receptor For (FCAR, Accession NM_133269) is another VGAM2652 host target gene. FCAR BINDING SITE1 through FCAR BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE5, designated SEQ ID:28424, SEQ ID:7728, SEQ ID:28428, SEQ ID:28426 and SEQ ID:28430 respectively, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89229] Another function of VGAM2652 is therefore inhibition of Fc Fragment of IgA, Receptor For (FCAR, Accession NM_133269), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCAR. The function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151) is another VGAM2652 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5659, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89230] Another function of VGAM2652 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage dis-

ease type I, von Gierke disease) (G6PC, Accession NM_000151). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. G Protein-coupled Receptor 56 (GPR56, Accession NM_005682) is another VGAM2652 host target gene. GPR56 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR56 BINDING SITE, designated SEQ ID:12240, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89231] Another function of VGAM2652 is therefore inhibition of G Protein-coupled Receptor 56 (GPR56, Accession NM_005682), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR56. The function of GPR56 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM782.Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM_005898) is another VGAM2652 host target gene. M11S1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by M11S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M11S1 BINDING SITE, designated SEQ ID:12519, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89232] Another function of VGAM2652 is therefore inhibition of Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM_005898), a gene which may play a role in transporting nutrients from the gut lumen across the gutlining epithelial cell layer. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M11S1. The function of M11S1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131.Male Germ Cell-associated Kinase (MAK, Ac-

cession NM_005906) is another VGAM2652 host target gene. MAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:12530, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89233] Another function of VGAM2652 is therefore inhibition of Male Germ Cell-associated Kinase (MAK, Accession NM_005906), a gene which plays an important role in spermatogenesis. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK. The function of MAK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1322.MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587) is another VGAM2652 host target gene. MEF2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

MEF2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE, designated SEQ ID:12117, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89234] Another function of VGAM2652 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2A. The function of MEF2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.MHC Class II Transactivator (MHC2TA, Accession NM_000246) is another VGAM2652 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5781, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89235] Another function of VGAM2652 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM_000246). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM_005373) is another VGAM2652 host target gene. MPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPL BINDING SITE, designated SEQ ID:11851, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89236] Another function of VGAM2652 is therefore inhibition of Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM_005373). Accordingly, utilities of VGAM2652 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with MPL. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is another VGAM2652 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15292, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89237] Another function of VGAM2652 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Phosphodiesterase 6B, CGMP-specific, Rod, Beta

(congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283) is another VGAM2652 host target gene. PDE6B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE6B BINDING SITE, designated SEQ ID:5829, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89238] Another function of VGAM2652 is therefore inhibition of Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6B. Phosphoinositide-3-kinase, Catalytic, Delta Polypeptide (PIK3CD, Accession NM_005026) is another VGAM2652 host target gene. PIK3CD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3CD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3CD BINDING SITE, designated SEQ ID:11464, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89239] Another function of VGAM2652 is therefore inhibition of Phosphoinositide-3-kinase, Catalytic, Delta Polypeptide (PIK3CD, Accession NM_005026), a gene which regulating cell growth. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3CD. The function of PIK3CD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2434.POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM2652 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12893, to the nucleotide sequence of

VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89240] Another function of VGAM2652 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.Protein Kinase, Interferon-inducible Double Stranded RNA Dependent (PRKR, Accession NM_002759) is another VGAM2652 host target gene. PRKR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKR BINDING SITE, designated SEQ ID:8646, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89241] Another function of VGAM2652 is therefore inhibition of Protein Kinase, Interferon-inducible Double Stranded RNA Dependent (PRKR, Accession NM_002759), a gene which catalyze the phosphorylation of the alpha subunit of eif2. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKR. The function of PRKR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1890.Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553) is another VGAM2652 host target gene. RBBP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ ID:34747, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89242] Another function of VGAM2652 is therefore inhibition of Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553). Accordingly, utilities of VGAM2652 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM2652 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11498, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89243] Another function of VGAM2652 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314.Thromboxane A2 Receptor (TBXA2R, Accession NM_001060) is another VGAM2652 host target gene.

TBXA2R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBXA2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:6728, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89244] Another function of VGAM2652 is therefore inhibition of Thromboxane A2 Receptor (TBXA2R, Accession NM_001060), a gene which activates Ca2+-activated chloride channels; stimulates platelet aggregation and smooth muscle constriction. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM_138691) is another VGAM2652 host target gene. TMC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by TMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMC1 BINDING SITE, designated SEQ ID:28934, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89245] Another function of VGAM2652 is therefore inhibition of Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM_138691), a gene which is required for normal function of cochlear hair cells. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMC1. The function of TMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM554.Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842) is another VGAM2652 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9938, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89246] Another function of VGAM2652 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400.TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619) is another VGAM2652 host target gene. TRAF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:10968, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5363.

[89247] Another function of VGAM2652 is therefore inhibition of TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5. The function of TRAF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM76.Von Hippel-Lindau Syndrome (VHL, Accession NM_000551) is another VGAM2652 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6165, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89248] Another function of VGAM2652 is therefore inhibition of Von Hippel-Lindau Syndrome (VHL, Accession

NM_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM197.Rho GTPase Activating Protein 9 (ARHGAP9, Accession NM_032496) is another VGAM2652 host target gene. ARHGAP9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHGAP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP9 BINDING SITE, designated SEQ ID:26248, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89249] Another function of VGAM2652 is therefore inhibition of Rho GTPase Activating Protein 9 (ARHGAP9, Accession NM_032496). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP9. Ankyrin Repeat

and SOCS Box-containing 16 (ASB16, Accession NM_080863) is another VGAM2652 host target gene. ASB16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ASB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:28108, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89250] Another function of VGAM2652 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession NM_080863). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16. BA108L7.2 (Accession NM_030971) is another VGAM2652 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, desig-

nated SEQ ID:25241, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89251] Another function of VGAM2652 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. C6orf5 (Accession NM_015524) is another VGAM2652 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:17782, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89252] Another function of VGAM2652 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444) is another VGAM2652 host target gene.

CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18907, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89253] Another function of VGAM2652 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. Collectin Subfamily Member 12 (COLEC12, Accession NM_030781) is another VGAM2652 host target gene. COLEC12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COLEC12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLEC12 BINDING SITE, designated SEQ ID:25071, to the nucleotide sequence of VGAM2652 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5363.

[89254] Another function of VGAM2652 is therefore inhibition of Collectin Sub-family Member 12 (COLEC12, Accession NM_030781). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC12. Cylicin, Basic Protein of Sperm Head Cytoskeleton 2 (CYLC2, Accession NM_001340) is another VGAM2652 host target gene. CYLC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLC2 BINDING SITE, designated SEQ ID:7019, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89255] Another function of VGAM2652 is therefore inhibition of Cylicin, Basic Protein of Sperm Head Cytoskeleton 2 (CYLC2, Accession NM_001340). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLC2. DKFZp434A2417 (Accession XM_038526) is another VGAM2652 host target gene. DKFZp434A2417 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32865, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89256] Another function of VGAM2652 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. DKFZP434D146 (Accession NM_015595) is another VGAM2652 host target gene. DKFZP434D146 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434D146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D146 BINDING SITE, designated SEQ ID:17873, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5363.

[89257] Another function of VGAM2652 is therefore inhibition of DKFZP434D146 (Accession NM_015595). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D146. DKFZp547H025 (Accession NM_020161) is another VGAM2652 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21374, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89258] Another function of VGAM2652 is therefore inhibition of DKFZp547H025 (Accession NM_020161). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025. DKFZP564G092 (Accession NM_015601) is another VGAM2652 host target gene. DKFZP564G092 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by DKFZP564G092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:17877, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89259] Another function of VGAM2652 is therefore inhibition of DKFZP564G092 (Accession NM_015601). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092. Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665) is another VGAM2652 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12208, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89260] Another function of VGAM2652 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FLJ12687 (Accession NM_024917) is another VGAM2652 host target gene. FLJ12687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12687 BINDING SITE, designated SEQ ID:24446, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89261] Another function of VGAM2652 is therefore inhibition of FLJ12687 (Accession NM_024917). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12687. FLJ13188 (Accession NM_022063) is another VGAM2652 host target gene. FLJ13188 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13188, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13188 BINDING SITE, designated SEQ ID:22608, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89262] Another function of VGAM2652 is therefore inhibition of FLJ13188 (Accession NM_022063). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13188. FLJ14957 (Accession NM_032866) is another VGAM2652 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:26683, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89263] Another function of VGAM2652 is therefore inhibition of FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14957. FLJ20034 (Accession NM_017630) is another VGAM2652 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19137, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89264] Another function of VGAM2652 is therefore inhibition of FLJ20034 (Accession NM_017630). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. FLJ22002 (Accession NM_024838) is another VGAM2652 host target gene. FLJ22002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22002 BINDING SITE, designated SEQ ID:24248, to the nucleotide

sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89265] Another function of VGAM2652 is therefore inhibition of FLJ22002 (Accession NM_024838). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22002. FLJ22531 (Accession NM_024650) is another VGAM2652 host target gene. FLJ22531 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22531 BINDING SITE, designated SEQ ID:23947, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89266] Another function of VGAM2652 is therefore inhibition of FLJ22531 (Accession NM_024650). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531. FLJ22794 (Accession XM_166220) is another VGAM2652 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44036, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89267] Another function of VGAM2652 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. FLJ31153 (Accession NM_144600) is another VGAM2652 host target gene. FLJ31153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:29414, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89268] Another function of VGAM2652 is therefore inhibition of FLJ31153 (Accession NM_144600). Accordingly, utilities of

VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153. FLJ32865 (Accession NM_144613) is another VGAM2652 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29431, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89269] Another function of VGAM2652 is therefore inhibition of FLJ32865 (Accession NM_144613). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM2652 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GP5 BINDING SITE, designated SEQ ID:10822, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89270] Another function of VGAM2652 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5. GTPBG3 (Accession NM_032620) is another VGAM2652 host target gene. GTPBG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTPBG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE, designated SEQ ID:26334, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89271] Another function of VGAM2652 is therefore inhibition of GTPBG3 (Accession NM_032620). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3. Histamine Receptor H4 (HRH4, Accession

NM_021624) is another VGAM2652 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22262, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89272] Another function of VGAM2652 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM_021624). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. HSMPP8 (Accession XM_167894) is another VGAM2652 host target gene. HSMPP8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSMPP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:44904, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ

ID:5363.

[89273] Another function of VGAM2652 is therefore inhibition of HSMPP8 (Accession XM_167894). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8. KIAA0472 (Accession XM_050147) is another VGAM2652 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35582, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89274] Another function of VGAM2652 is therefore inhibition of KIAA0472 (Accession XM_050147). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA0513 (Accession NM_014732) is another VGAM2652 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0513, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16360, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89275] Another function of VGAM2652 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0555 (Accession NM_014790) is another VGAM2652 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:16686, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89276] Another function of VGAM2652 is therefore inhibition of KIAA0555 (Accession NM_014790). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0555. KIAA0557 (Accession XM_085507) is another VGAM2652 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38210, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89277] Another function of VGAM2652 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0836 (Accession XM_035390) is another VGAM2652 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32248, to the

nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89278] Another function of VGAM2652 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. KIAA0924 (Accession NM_014897) is another VGAM2652 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17066, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89279] Another function of VGAM2652 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA1028 (Accession XM_166324) is another VGAM2652 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44163, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89280] Another function of VGAM2652 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. KIAA1373 (Accession XM_048195) is another VGAM2652 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35129, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89281] Another function of VGAM2652 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities

of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. KIAA1473 (Accession XM_047550) is another VGAM2652 host target gene. KIAA1473 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1473 BINDING SITE, designated SEQ ID:34997, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89282] Another function of VGAM2652 is therefore inhibition of KIAA1473 (Accession XM_047550). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1473. KIAA1617 (Accession XM_166140) is another VGAM2652 host target gene. KIAA1617 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1617 BINDING SITE, designated SEQ ID:43944, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89283] Another function of VGAM2652 is therefore inhibition of KIAA1617 (Accession XM_166140). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1617. KIAA1712 (Accession XM_041497) is another VGAM2652 host target gene. KIAA1712 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:33539, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89284] Another function of VGAM2652 is therefore inhibition of KIAA1712 (Accession XM_041497). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712. KIAA1737 (Accession XM_041115) is another VGAM2652 host target gene. KIAA1737 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:33449, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89285] Another function of VGAM2652 is therefore inhibition of KIAA1737 (Accession XM_041115). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737. KIAA1826 (Accession XM_040784) is another VGAM2652 host target gene. KIAA1826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1826 BINDING SITE, designated SEQ ID:33376, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89286] Another function of VGAM2652 is therefore inhibition of

KIAA1826 (Accession XM_040784). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1826. MGC4638 (Accession NM_031479) is another VGAM2652 host target gene. MGC4638 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4638 BINDING SITE, designated SEQ ID:25558, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89287] Another function of VGAM2652 is therefore inhibition of MGC4638 (Accession NM_031479). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4638. Mitochondrial Ribosomal Protein L44 (MRPL44, Accession NM_022915) is another VGAM2652 host target gene. MRPL44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MRPL44 BINDING SITE, designated SEQ ID:23228, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89288] Another function of VGAM2652 is therefore inhibition of Mitochondrial Ribosomal Protein L44 (MRPL44, Accession NM_022915). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL44. NDP52 (Accession NM_005831) is another VGAM2652 host target gene. NDP52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDP52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP52 BINDING SITE, designated SEQ ID:12445, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89289] Another function of VGAM2652 is therefore inhibition of NDP52 (Accession NM_005831). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with NDP52. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM2652 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22812, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89290] Another function of VGAM2652 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. PRO0529 (Accession NM_014074) is another VGAM2652 host target gene. PRO0529 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0529 BINDING SITE, designated SEQ ID:15300, to the nucleotide

sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89291] Another function of VGAM2652 is therefore inhibition of PRO0529 (Accession NM_014074). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0529. PRO2955 (Accession NM_018545) is another VGAM2652 host target gene. PRO2955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2955 BINDING SITE, designated SEQ ID:20622, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89292] Another function of VGAM2652 is therefore inhibition of PRO2955 (Accession NM_018545). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2955. Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM_024430) is another VGAM2652 host target gene. PSTPIP2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSTPIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSTPIP2 BINDING SITE, designated SEQ ID:23683, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89293] Another function of VGAM2652 is therefore inhibition of Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM_024430). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP2. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296) is another VGAM2652 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:25330, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ

ID:5363.

[89294] Another function of VGAM2652 is therefore inhibition of RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B. SCAN Domain Containing 2 (SCAND2, Accession NM_022050) is another VGAM2652 host target gene. SCAND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAND2 BINDING SITE, designated SEQ ID:22577, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89295] Another function of VGAM2652 is therefore inhibition of SCAN Domain Containing 2 (SCAND2, Accession NM_022050). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAND2. SCYA22 (Accession XM_165651) is another VGAM2652 host target gene. SCYA22 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SCYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA22 BINDING SITE, designated SEQ ID:43716, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89296] Another function of VGAM2652 is therefore inhibition of SCYA22 (Accession XM_165651). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA22. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM2652 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:12710, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89297] Another function of VGAM2652 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231) is another VGAM2652 host target gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:14104, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89298] Another function of VGAM2652 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. Synaptosomal-associated Protein, 91kDa Homolog (mouse) (SNAP91, Accession NM_014841)

is another VGAM2652 host target gene. SNAP91 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNAP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP91 BINDING SITE, designated SEQ ID:16871, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89299] Another function of VGAM2652 is therefore inhibition of Synaptosomal-associated Protein, 91kDa Homolog (mouse) (SNAP91, Accession NM_014841). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP91. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_014418) is another VGAM2652 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING SITE4, designated SEQ ID:15769,

SEQ ID:21762, SEQ ID:14845 and SEQ ID:21771 respectively, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89300] Another function of VGAM2652 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_014418). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. TU12B1-TY (Accession NM_016575) is another VGAM2652 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18650, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89301] Another function of VGAM2652 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

TU12B1-TY. Ubiquitin Specific Protease 3 (USP3, Accession XM_116973) is another VGAM2652 host target gene. USP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP3 BINDING SITE, designated SEQ ID:43172, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89302] Another function of VGAM2652 is therefore inhibition of Ubiquitin Specific Protease 3 (USP3, Accession XM_116973). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP3. Zinc Finger Protein 338 (ZNF338, Accession NM_022088) is another VGAM2652 host target gene. ZNF338 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF338 BINDING SITE, designated SEQ ID:22634, to the nucleotide

sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89303] Another function of VGAM2652 is therefore inhibition of Zinc Finger Protein 338 (ZNF338, Accession NM_022088). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF338. LOC113675 (Accession NM_138432) is another VGAM2652 host target gene. LOC113675 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC113675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113675 BINDING SITE, designated SEQ ID:28796, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89304] Another function of VGAM2652 is therefore inhibition of LOC113675 (Accession NM_138432). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113675. LOC126364 (Accession XM_065047) is another VGAM2652 host target gene. LOC126364 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126364 BINDING SITE, designated SEQ ID:37272, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89305] Another function of VGAM2652 is therefore inhibition of LOC126364 (Accession XM_065047). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126364. LOC135293 (Accession XM_072402) is another VGAM2652 host target gene. LOC135293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:37497, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89306] Another function of VGAM2652 is therefore inhibition of

LOC135293 (Accession XM_072402). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. LOC143241 (Accession NM_138812) is another VGAM2652 host target gene. LOC143241 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143241 BINDING SITE, designated SEQ ID:29036, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89307] Another function of VGAM2652 is therefore inhibition of LOC143241 (Accession NM_138812). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143241. LOC144524 (Accession XM_096624) is another VGAM2652 host target gene. LOC144524 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC144524 BINDING SITE, designated SEQ ID:40435, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89308] Another function of VGAM2652 is therefore inhibition of LOC144524 (Accession XM_096624). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144524. LOC144776 (Accession XM_084964) is another VGAM2652 host target gene. LOC144776 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144776 BINDING SITE, designated SEQ ID:37788, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89309] Another function of VGAM2652 is therefore inhibition of LOC144776 (Accession XM_084964). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144776. LOC145757 (Accession XM_085227) is an-

other VGAM2652 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37974, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89310] Another function of VGAM2652 is therefore inhibition of LOC145757 (Accession XM_085227). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC146050 (Accession XM_085301) is another VGAM2652 host target gene. LOC146050 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146050 BINDING SITE, designated SEQ ID:38056, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89311] Another function of VGAM2652 is therefore inhibition of LOC146050 (Accession XM_085301). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146050. LOC146894 (Accession NM_145273) is another VGAM2652 host target gene. LOC146894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:29784, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89312] Another function of VGAM2652 is therefore inhibition of LOC146894 (Accession NM_145273). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894. LOC147817 (Accession XM_085903) is another VGAM2652 host target gene. LOC147817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147817, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38388, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89313] Another function of VGAM2652 is therefore inhibition of LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC148189 (Accession XM_086087) is another VGAM2652 host target gene. LOC148189 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:38485, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89314] Another function of VGAM2652 is therefore inhibition of LOC148189 (Accession XM_086087). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148189. LOC148198 (Accession XM_047554) is another VGAM2652 host target gene. LOC148198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148198 BINDING SITE, designated SEQ ID:35000, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89315] Another function of VGAM2652 is therefore inhibition of LOC148198 (Accession XM_047554). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148198. LOC149171 (Accession XM_086450) is another VGAM2652 host target gene. LOC149171 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149171 BINDING SITE, designated SEQ ID:38668, to the nucleotide sequence of VGAM2652 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5363.

[89316] Another function of VGAM2652 is therefore inhibition of LOC149171 (Accession XM_086450). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149171. LOC149267 (Accession NM_138480) is another VGAM2652 host target gene. LOC149267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149267 BINDING SITE, designated SEQ ID:28833, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89317] Another function of VGAM2652 is therefore inhibition of LOC149267 (Accession NM_138480). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149267. LOC149478 (Accession XM_086536) is another VGAM2652 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149478, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:38755, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89318] Another function of VGAM2652 is therefore inhibition of LOC149478 (Accession XM_086536). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC149577 (Accession XM_097675) is another VGAM2652 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41023, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89319] Another function of VGAM2652 is therefore inhibition of LOC149577 (Accession XM_097675). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149577. LOC149711 (Accession XM_097720) is another VGAM2652 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41075, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89320] Another function of VGAM2652 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC150054 (Accession XM_097797) is another VGAM2652 host target gene. LOC150054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:41126, to

the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89321] Another function of VGAM2652 is therefore inhibition of LOC150054 (Accession XM_097797). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054. LOC150696 (Accession NM_144707) is another VGAM2652 host target gene. LOC150696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150696 BINDING SITE, designated SEQ ID:29530, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89322] Another function of VGAM2652 is therefore inhibition of LOC150696 (Accession NM_144707). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150696. LOC151057 (Accession XM_097998) is another VGAM2652 host target gene. LOC151057 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC151057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151057 BINDING SITE, designated SEQ ID:41295, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89323] Another function of VGAM2652 is therefore inhibition of LOC151057 (Accession XM_097998). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151057. LOC152300 (Accession XM_087432) is another VGAM2652 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39252, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89324] Another function of VGAM2652 is therefore inhibition of LOC152300 (Accession XM_087432). Accordingly, utilities

of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC152925 (Accession XM_087559) is another VGAM2652 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39336, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89325] Another function of VGAM2652 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC157858 (Accession XM_098833) is another VGAM2652 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157858 BINDING SITE, designated SEQ ID:41869, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89326] Another function of VGAM2652 is therefore inhibition of LOC157858 (Accession XM_098833). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. LOC169611 (Accession XM_095809) is another VGAM2652 host target gene. LOC169611 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:40286, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89327] Another function of VGAM2652 is therefore inhibition of LOC169611 (Accession XM_095809). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611. LOC196264 (Accession XM_113683) is another VGAM2652 host target gene. LOC196264 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42337, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89328] Another function of VGAM2652 is therefore inhibition of LOC196264 (Accession XM_113683). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC196411 (Accession XM_113714) is another VGAM2652 host target gene. LOC196411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196411 BINDING SITE, designated SEQ ID:42365, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89329] Another function of VGAM2652 is therefore inhibition of

LOC196411 (Accession XM_113714). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196411. LOC199725 (Accession XM_117119) is another VGAM2652 host target gene. LOC199725 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199725 BINDING SITE, designated SEQ ID:43243, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89330] Another function of VGAM2652 is therefore inhibition of LOC199725 (Accession XM_117119). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199725. LOC199906 (Accession XM_114052) is another VGAM2652 host target gene. LOC199906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC199906 BINDING SITE, designated SEQ ID:42658, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89331] Another function of VGAM2652 is therefore inhibition of LOC199906 (Accession XM_114052). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199906. LOC200169 (Accession XM_117200) is another VGAM2652 host target gene. LOC200169 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200169 BINDING SITE, designated SEQ ID:43286, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89332] Another function of VGAM2652 is therefore inhibition of LOC200169 (Accession XM_117200). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200169. LOC200860 (Accession XM_117289) is an-

other VGAM2652 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43356, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89333] Another function of VGAM2652 is therefore inhibition of LOC200860 (Accession XM_117289). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860. LOC201411 (Accession XM_031946) is another VGAM2652 host target gene. LOC201411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201411 BINDING SITE, designated SEQ ID:31529, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89334] Another function of VGAM2652 is therefore inhibition of LOC201411 (Accession XM_031946). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201411. LOC201696 (Accession XM_032269) is another VGAM2652 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31626, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89335] Another function of VGAM2652 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC202908 (Accession XM_114602) is another VGAM2652 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:42998, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89336] Another function of VGAM2652 is therefore inhibition of LOC202908 (Accession XM_114602). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202908. LOC203197 (Accession XM_114645) is another VGAM2652 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43014, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89337] Another function of VGAM2652 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC203197. LOC220064 (Accession XM_167827) is another VGAM2652 host target gene. LOC220064 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220064 BINDING SITE, designated SEQ ID:44869, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89338] Another function of VGAM2652 is therefore inhibition of LOC220064 (Accession XM_167827). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220064. LOC220963 (Accession XM_166145) is another VGAM2652 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:43960, to the nucleotide sequence of VGAM2652 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5363.

[89339] Another function of VGAM2652 is therefore inhibition of LOC220963 (Accession XM_166145). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. LOC221174 (Accession XM_167915) is another VGAM2652 host target gene. LOC221174 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221174 BINDING SITE, designated SEQ ID:44912, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89340] Another function of VGAM2652 is therefore inhibition of LOC221174 (Accession XM_167915). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221174. LOC222031 (Accession XM_168371) is another VGAM2652 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222031, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45136, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89341] Another function of VGAM2652 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC257017 (Accession XM_173227) is another VGAM2652 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46498, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89342] Another function of VGAM2652 is therefore inhibition of LOC257017 (Accession XM_173227). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257017. LOC57107 (Accession NM_020381) is another VGAM2652 host target gene. LOC57107 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:21652, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89343] Another function of VGAM2652 is therefore inhibition of LOC57107 (Accession NM_020381). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107. LOC90591 (Accession XM_032811) is another VGAM2652 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31761, to the

nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89344] Another function of VGAM2652 is therefore inhibition of LOC90591 (Accession XM_032811). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. LOC91115 (Accession XM_036218) is another VGAM2652 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32400, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89345] Another function of VGAM2652 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. LOC91291 (Accession XM_037478) is another VGAM2652 host target gene. LOC91291 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC91291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91291 BINDING SITE, designated SEQ ID:32630, to the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, also designated SEQ ID:5363.

[89346] Another function of VGAM2652 is therefore inhibition of LOC91291 (Accession XM_037478). Accordingly, utilities of VGAM2652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91291. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2653 (VGAM2653) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89347] VGAM2653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2653 was detected is described hereinabove with reference to Figs. 1-8.

[89348] VGAM2653 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Sorghum Mosaic Virus. VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89349] VGAM2653 gene encodes a VGAM2653 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2653 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2653 precursor RNA is designated SEQ ID:2639, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2639 is located at position 9158 relative to the genome of Sorghum Mosaic Virus.

[89350] VGAM2653 precursor RNA folds onto itself, forming VGAM2653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89351] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2653 folded precursor RNA into VGAM2653 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2653 RNA is designated SEQ ID:5364, and is provided hereinbelow with reference to the sequence listing part.

[89352] VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2653 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89353] VGAM2653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2653 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89354] The complementary binding of VGAM2653 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2653

host target RNA into VGAM2653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89355] It is appreciated that VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2653 host target genes. The mRNA of each one of this plurality of VGAM2653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2653 RNA, herein designated VGAM RNA, and which when bound by VGAM2653 RNA causes inhibition of translation of respective one or more VGAM2653 host target proteins.

[89356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2653 gene, herein designated VGAM GENE, on one or more VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89357] It is yet further appreciated that a function of VGAM2653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of viral infection by Sorghum Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2653 correlate with, and may be deduced from, the identity of the host target genes which VGAM2653 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89358] Nucleotide sequences of the VGAM2653 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2653 are further

described hereinbelow with reference to Table 1.

[89359] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2653 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89360] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2653 gene, herein designated VGAM is inhibition of expression of VGAM2653 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2653 correlate with, and may be deduced from, the identity of the target genes which VGAM2653 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89361] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813) is a VGAM2653 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:22378, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89362] A function of VGAM2653 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331.Cyclin-dependent Kinase Inhibitor 2C (p18, inhibits CDK4) (CDKN2C, Accession NM_001262) is another VGAM2653 host target gene. CDKN2C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDKN2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2C BINDING SITE, designated SEQ ID:6928, to the nucleotide

sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89363] Another function of VGAM2653 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2C (p18, inhibits CDK4) (CDKN2C, Accession NM_001262), a gene which associate with cyclin-CDK complexes or CDKs alone and inhibit their activity. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2C. The function of CDKN2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2054.Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM_022059) is another VGAM2653 host target gene. CXCL16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXCL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:22599, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89364] Another function of VGAM2653 is therefore inhibition of Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM_022059), a gene which induces calcium mobilization. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16. The function of CXCL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1845.Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM_001415) is another VGAM2653 host target gene. EIF2S3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF2S3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2S3 BINDING SITE, designated SEQ ID:7111, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89365] Another function of VGAM2653 is therefore inhibition of Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM_001415), a gene

which functions in the early steps of protein synthesis. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S3. The function of EIF2S3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1254.Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM_000598) is another VGAM2653 host target gene. IGFBP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IGFBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP3 BINDING SITE, designated SEQ ID:6198, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89366] Another function of VGAM2653 is therefore inhibition of Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM_000598). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP3. Mel Trans-

forming Oncogene (derived from cell line NK14)- RAB8 Homolog (MEL, Accession NM_005370) is another VGAM2653 host target gene. MEL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEL BINDING SITE, designated SEQ ID:11845, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89367] Another function of VGAM2653 is therefore inhibition of Mel Transforming Oncogene (derived from cell line NK14)- RAB8 Homolog (MEL, Accession NM_005370), a gene which may be involved in vesicular trafficking and neurotransmitter release. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEL. The function of MEL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM40.Oxidative-stress Responsive 1 (OSR1, Accession NM_005109) is another VGAM2653 host target gene.

OSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:11589, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89368] Another function of VGAM2653 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM_005109), a gene which mediats stress-activated signals. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538.Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM2653 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10127, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89369] Another function of VGAM2653 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87.Transcription Factor EB (TFEB, Accession XM_166390) is another VGAM2653 host target gene. TFEB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TFEB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFEB BINDING SITE, designated SEQ ID:44239, to the nu-

cleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89370] Another function of VGAM2653 is therefore inhibition of Transcription Factor EB (TFEB, Accession XM_166390), a gene which may function as a transcription factor. Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFEB. The function of TFEB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is another VGAM2653 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:25400, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89371] Another function of VGAM2653 is therefore inhibition of

Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. C16orf5 (Accession NM_013399) is another VGAM2653 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15052, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89372] Another function of VGAM2653 is therefore inhibition of C16orf5 (Accession NM_013399). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. DKFZP566K1924 (Accession XM_057469) is another VGAM2653 host target gene. DKFZP566K1924 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36520, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89373] Another function of VGAM2653 is therefore inhibition of DKFZP566K1924 (Accession XM_057469). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. Dihydropyrimidinase-like 4 (DPYSL4, Accession NM_006426) is another VGAM2653 host target gene. DPYSL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPYSL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL4 BINDING SITE, designated SEQ ID:13141, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89374] Another function of VGAM2653 is therefore inhibition of Dihydropyrimidinase-like 4 (DPYSL4, Accession

NM_006426). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL4. FLJ00024 (Accession XM_033361) is another VGAM2653 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31889, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89375] Another function of VGAM2653 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ11383 (Accession NM_024938) is another VGAM2653 host target gene. FLJ11383 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ11383 BINDING SITE, designated SEQ ID:24476, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89376] Another function of VGAM2653 is therefore inhibition of FLJ11383 (Accession NM_024938). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11383. FLJ13114 (Accession NM_024541) is another VGAM2653 host target gene. FLJ13114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:23749, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89377] Another function of VGAM2653 is therefore inhibition of FLJ13114 (Accession NM_024541). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114. FLJ32865 (Accession NM_144613) is another

VGAM2653 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29425, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89378] Another function of VGAM2653 is therefore inhibition of FLJ32865 (Accession NM_144613). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. HEF1 (Accession NM_006403) is another VGAM2653 host target gene. HEF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEF1 BINDING SITE, designated SEQ ID:13111, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89379] Another function of VGAM2653 is therefore inhibition of HEF1 (Accession NM_006403). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEF1. Immune Associated Nucleotide 4 Like 1 (mouse) (IAN4L1, Accession NM_018384) is another VGAM2653 host target gene. IAN4L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IAN4L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IAN4L1 BINDING SITE, designated SEQ ID:20416, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89380] Another function of VGAM2653 is therefore inhibition of Immune Associated Nucleotide 4 Like 1 (mouse) (IAN4L1, Accession NM_018384). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IAN4L1. KIAA1260 (Accession XM_010461) is another VGAM2653 host target gene. KIAA1260 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by KIAA1260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1260 BINDING SITE, designated SEQ ID:30157, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89381] Another function of VGAM2653 is therefore inhibition of KIAA1260 (Accession XM_010461). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1260. MGC12837 (Accession NM_032726) is another VGAM2653 host target gene. MGC12837 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC12837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12837 BINDING SITE, designated SEQ ID:26452, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89382] Another function of VGAM2653 is therefore inhibition of MGC12837 (Accession NM_032726). Accordingly, utilities

of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12837. N4BP3 (Accession XM_038920) is another VGAM2653 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32933, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89383] Another function of VGAM2653 is therefore inhibition of N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714) is another VGAM2653 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:28955, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89384] Another function of VGAM2653 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2653 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30772, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89385] Another function of VGAM2653 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities

of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM2653 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32560, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89386] Another function of VGAM2653 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. Syntaxin 1B2 (STX1B2, Accession NM_052874) is another VGAM2653 host target gene. STX1B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STX1B2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX1B2 BINDING SITE, designated SEQ ID:27455, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89387] Another function of VGAM2653 is therefore inhibition of Syntaxin 1B2 (STX1B2, Accession NM_052874). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX1B2. Vacuolar Protein Sorting 4B (yeast) (VPS4B, Accession NM_004869) is another VGAM2653 host target gene. VPS4B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VPS4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS4B BINDING SITE, designated SEQ ID:11293, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89388] Another function of VGAM2653 is therefore inhibition of Vacuolar Protein Sorting 4B (yeast) (VPS4B, Accession

NM_004869). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS4B. LOC144871 (Accession XM_096698) is another VGAM2653 host target gene. LOC144871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:40469, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89389] Another function of VGAM2653 is therefore inhibition of LOC144871 (Accession XM_096698). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871. LOC158987 (Accession XM_099015) is another VGAM2653 host target gene. LOC158987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC158987 BINDING SITE, designated SEQ ID:42046, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89390] Another function of VGAM2653 is therefore inhibition of LOC158987 (Accession XM_099015). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158987. LOC201164 (Accession XM_113904) is another VGAM2653 host target gene. LOC201164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:42529, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89391] Another function of VGAM2653 is therefore inhibition of LOC201164 (Accession XM_113904). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164. LOC255308 (Accession XM_170536) is an-

other VGAM2653 host target gene. LOC255308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255308 BINDING SITE, designated SEQ ID:45354, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89392] Another function of VGAM2653 is therefore inhibition of LOC255308 (Accession XM_170536). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255308. LOC256821 (Accession XM_175144) is another VGAM2653 host target gene. LOC256821 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256821 BINDING SITE, designated SEQ ID:46638, to the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, also designated SEQ ID:5364.

[89393] Another function of VGAM2653 is therefore inhibition of LOC256821 (Accession XM_175144). Accordingly, utilities of VGAM2653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256821. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2654 (VGAM2654) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89394] VGAM2654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2654 was detected is described hereinabove with reference to Figs. 1-8.

[89395] VGAM2654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum Mosaic Virus. VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89396] VGAM2654 gene encodes a VGAM2654 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2654 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2654 precursor RNA is designated SEQ ID:2640, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2640 is located at position 2508 relative to the genome of Sorghum Mosaic Virus.

[89397] VGAM2654 precursor RNA folds onto itself, forming VGAM2654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89398] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2654 folded precursor RNA into VGAM2654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2654 RNA is designated SEQ ID:5365, and is provided hereinbelow with reference to the sequence listing part.

[89399] VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2654 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89400] VGAM2654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2654 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89401] The complementary binding of VGAM2654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2654 host target RNA into VGAM2654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89402] It is appreciated that VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2654 host target genes. The mRNA of each one of this plurality of VGAM2654 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2654 RNA, herein designated VGAM RNA, and which when bound by VGAM2654 RNA causes inhibition of translation of respective one or more VGAM2654 host target proteins.

[89403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2654 gene, herein designated VGAM GENE, on one or more VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89404] It is yet further appreciated that a function of VGAM2654 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2654 include diagnosis, prevention and treatment of viral infection by Sorghum Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2654 correlate with, and may be deduced from, the identity of the host target genes which VGAM2654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89405] Nucleotide sequences of the VGAM2654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2654 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2654 are further described hereinbelow with reference to Table 1.

[89406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2654 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2654 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[89407] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2654 gene, herein designated VGAM is inhibition of expression of VGAM2654 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2654 correlate with, and may be deduced from, the identity of the target genes which VGAM2654 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89408] Zinc Finger Protein 215 (ZNF215, Accession NM_013250) is a VGAM2654 host target gene. ZNF215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF215 BINDING SITE, designated SEQ ID:14911, to the nucleotide sequence of VGAM2654 RNA, herein designated VGAM RNA, also designated SEQ ID:5365.

[89409] A function of VGAM2654 is therefore inhibition of Zinc Finger Protein 215 (ZNF215, Accession NM_013250). Accordingly, utilities of VGAM2654 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ZNF215. FLJ21820 (Accession NM_021925) is another VGAM2654 host target gene. FLJ21820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21820 BINDING SITE, designated SEQ ID:22452, to the nucleotide sequence of VGAM2654 RNA, herein designated VGAM RNA, also designated SEQ ID:5365.

[89410] Another function of VGAM2654 is therefore inhibition of FLJ21820 (Accession NM_021925). Accordingly, utilities of VGAM2654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21820. Spermatid Perinuclear RNA Binding Protein (STRBP, Accession NM_018387) is another VGAM2654 host target gene. STRBP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STRBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRBP BINDING SITE, des-

ignated SEQ ID:20418, to the nucleotide sequence of VGAM2654 RNA, herein designated VGAM RNA, also designated SEQ ID:5365.

[89411] Another function of VGAM2654 is therefore inhibition of Spermatid Perinuclear RNA Binding Protein (STRBP, Accession NM_018387). Accordingly, utilities of VGAM2654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRBP. LOC149302 (Accession XM_086489) is another VGAM2654 host target gene. LOC149302 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:38707, to the nucleotide sequence of VGAM2654 RNA, herein designated VGAM RNA, also designated SEQ ID:5365.

[89412] Another function of VGAM2654 is therefore inhibition of LOC149302 (Accession XM_086489). Accordingly, utilities of VGAM2654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149302. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2655 (VGAM2655) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89413] VGAM2655 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2655 was detected is described hereinabove with reference to Figs. 1-8.

[89414] VGAM2655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum Mosaic Virus. VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89415] VGAM2655 gene encodes a VGAM2655 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2655 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2655 precursor RNA is designated SEQ ID:2641, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2641 is located at position 8865 relative to the genome of Sorghum Mosaic Virus.

[89416] VGAM2655 precursor RNA folds onto itself, forming VGAM2655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89417] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2655 folded precursor RNA into VGAM2655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM2655 RNA is designated SEQ ID:5366, and is provided hereinbelow with reference to the sequence listing part.

[89418] VGAM2655 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2655 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89419] VGAM2655 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2655 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2655 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89420] The complementary binding of VGAM2655 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2655 host target RNA into VGAM2655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89421] It is appreciated that VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2655 host target genes. The mRNA of each one of this plurality of VGAM2655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2655 RNA, herein designated VGAM RNA, and which when bound by VGAM2655 RNA causes inhibition of translation of respective one or more

VGAM2655 host target proteins.

[89422] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2655 gene, herein designated VGAM GENE, on one or more VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89423] It is yet further appreciated that a function of VGAM2655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2655 include diagnosis, prevention and treatment of viral infection by Sorghum Mosaic Virus. Spe-

cific functions, and accordingly utilities, of VGAM2655 correlate with, and may be deduced from, the identity of the host target genes which VGAM2655 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89424] Nucleotide sequences of the VGAM2655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2655 are further described hereinbelow with reference to Table 1.

[89425] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2655 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89426] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2655 gene, herein designated VGAM is inhibition of expression of VGAM2655 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2655 correlate with, and may be deduced from, the identity of the target genes which VGAM2655 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89427] AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080551) is a VGAM2655 host target gene. AP1GBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP1GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:27880, to the nucleotide sequence of VGAM2655 RNA, herein designated VGAM RNA, also designated SEQ ID:5366.

[89428] A function of VGAM2655 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080551). Accordingly, utilities of VGAM2655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. LOC158055 (Accession XM_088453) is another VGAM2655 host target gene. LOC158055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC158055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158055 BINDING SITE, designated SEQ ID:39705, to the nucleotide sequence of VGAM2655 RNA, herein designated VGAM RNA, also designated SEQ ID:5366.

[89429] Another function of VGAM2655 is therefore inhibition of LOC158055 (Accession XM_088453). Accordingly, utilities of VGAM2655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158055. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2656 (VGAM2656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89430] VGAM2656 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2656 was detected is described hereinabove with reference to Figs. 1-8.

[89431] VGAM2656 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Potato Virus A. VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89432] VGAM2656 gene encodes a VGAM2656 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2656 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2656 precursor RNA is designated SEQ ID:2642, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2642 is located at position 5538 relative to the genome of Potato Virus A.

[89433] VGAM2656 precursor RNA folds onto itself, forming VGAM2656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89434] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2656 folded precursor RNA into VGAM2656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2656 RNA is designated SEQ ID:5367, and is provided hereinbelow with reference to the sequence listing part.

[89435] VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2656 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89436] VGAM2656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2656 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89437] The complementary binding of VGAM2656 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2656

host target RNA into VGAM2656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89438] It is appreciated that VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2656 host target genes. The mRNA of each one of this plurality of VGAM2656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2656 RNA, herein designated VGAM RNA, and which when bound by VGAM2656 RNA causes inhibition of translation of respective one or more VGAM2656 host target proteins.

[89439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2656 gene, herein designated VGAM GENE, on one or more VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89440] It is yet further appreciated that a function of VGAM2656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2656 correlate with, and may be deduced from, the identity of the host target genes which VGAM2656 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89441] Nucleotide sequences of the VGAM2656 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2656 are further

described hereinbelow with reference to Table 1.

[89442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2656 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89443] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2656 gene, herein designated VGAM is inhibition of expression of VGAM2656 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2656 correlate with, and may be deduced from, the identity of the target genes which VGAM2656 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89444] ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502) is a VGAM2656 host target gene. ABCA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ABCA1 BINDING SITE, designated SEQ ID:12011, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89445] A function of VGAM2656 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502), a gene which camp-dependent and sulfonylurea-sensitive anion transporter. Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA1. The function of ABCA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1956.HLA-G Histocompatibility Antigen, Class I, G (HLA-G, Accession NM_002127) is another VGAM2656 host target gene. HLA-G BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HLA-G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLA-G BINDING SITE, designated SEQ ID:7906, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA,

also designated SEQ ID:5367.

[89446] Another function of VGAM2656 is therefore inhibition of HLA-G Histocompatibility Antigen, Class I, G (HLA-G, Accession NM_002127), a gene which involved in the presentation of foreign antigens to the immune system. Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-G. The function of HLA-G has been established by previous studies. Extravillous trophoblast from normal human placenta and the BeWo adherent human choriocarcinoma cell line express an unusual form of class I HLA molecule. This molecule has an H chain of approximately 40 kD and is apparently nonpolymorphic. Ellis et al. (1990) isolated and sequenced a cDNA clone for this class I HLA antigen. The nucleotide sequence showed a high degree of homology with the published sequence of a genomic clone, HLA 6.0, which is the product of a class I locus other than A, B, or C. The new locus was provisionally designated HLAG. Using PCR, Ellis et al. (1990) demonstrated similar HLA class I sequences in cDNA from normal extravillous trophoblasts. Although there was some nucleotide sequence polymorphism, the amino acid sequence of the molecule was conserved; hence, it is un-

likely to provoke immune responses even though it is found at the fetal-maternal interface. Considering the well established role of nonclassic HLA-G class I molecules in inhibiting natural killer cell function, the consequence of abnormal HLA-G expression in malignant cells should be the escape of tumors from immunosurveillance. To examine this hypothesis, Paul et al. (1998) analyzed HLA-G expression and NK sensitivity in human malignant melanoma cells. Two melanoma cell lines exhibited a high level of HLA-G transcription with differential HLA-G isoform transcription and protein expression patterns. A higher level of HLA-G transcription ex vivo was detected in a skin melanoma metastasis biopsy compared with a healthy skin fragment from the same individual. HLA-G protein isoforms other than membrane-bound HLA-G1 protected 1 melanoma cell line from NK lysis. It thus appeared of critical importance to consider the specific role of HLA-G expression in tumors in the design of cancer immunotherapies.

[89447] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[89448] Ellis, S. A.; Palmer, M. S.; McMichael, A. J. : Human tro-

phoblast and the choriocarcinoma cell line BeWo express a truncated HLA class I molecule. J. Immun. 144: 731-735, 1990. ; and

[89449] Paul, P.; Rouas-Freiss, N.; Khalil-Daher, I.; Moreau, P.; Riteau, B.; Le Gal, F. A.; Avril, M. F.; Dausset, J.; Guillet, J. G.; Carosella, E. D. : HLA-G expression in melanoma: a way fo.

[89450] Further studies establishing the function and utilities of HLA-G are found in John Hopkins OMIM database record ID 142871, and in sited publications numbered 3295, 11451-11460, 3781, 11461-1146 and 11499-11501 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DKFZp761F2014 (Accession NM_020215) is another VGAM2656 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21457, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89451] Another function of VGAM2656 is therefore inhibition of DKFZp761F2014 (Accession NM_020215). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. KIAA1463 (Accession XM_051160) is another VGAM2656 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35768, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89452] Another function of VGAM2656 is therefore inhibition of KIAA1463 (Accession XM_051160). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. MGC2488 (Accession NM_024039) is another VGAM2656 host target gene. MGC2488 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2488, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2488 BINDING SITE, designated SEQ ID:23473, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89453] Another function of VGAM2656 is therefore inhibition of MGC2488 (Accession NM_024039). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2488. MGC2560 (Accession NM_031452) is another VGAM2656 host target gene. MGC2560 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2560 BINDING SITE, designated SEQ ID:25466, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89454] Another function of VGAM2656 is therefore inhibition of MGC2560 (Accession NM_031452). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2560. Synaptotagmin XIII (SYT13, Accession XM_167880) is another VGAM2656 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44886, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89455] Another function of VGAM2656 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM_167880). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. LOC113523 (Accession XM_054378) is another VGAM2656 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, desig-

nated SEQ ID:36150, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89456] Another function of VGAM2656 is therefore inhibition of LOC113523 (Accession XM_054378). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. LOC147343 (Accession XM_097225) is another VGAM2656 host target gene. LOC147343 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147343 BINDING SITE, designated SEQ ID:40830, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89457] Another function of VGAM2656 is therefore inhibition of LOC147343 (Accession XM_097225). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147343. LOC150245 (Accession XM_097843) is another VGAM2656 host target gene. LOC150245 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41161, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89458] Another function of VGAM2656 is therefore inhibition of LOC150245 (Accession XM_097843). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150245. LOC220477 (Accession XM_071675) is another VGAM2656 host target gene. LOC220477 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220477 BINDING SITE, designated SEQ ID:37407, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89459] Another function of VGAM2656 is therefore inhibition of

LOC220477 (Accession XM_071675). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220477. LOC254700 (Accession XM_171244) is another VGAM2656 host target gene. LOC254700 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254700 BINDING SITE, designated SEQ ID:46037, to the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, also designated SEQ ID:5367.

[89460] Another function of VGAM2656 is therefore inhibition of LOC254700 (Accession XM_171244). Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254700. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2657 (VGAM2657) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[89461] VGAM2657 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2657 was detected is described hereinabove with reference to Figs. 1-8.

[89462] VGAM2657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89463] VGAM2657 gene encodes a VGAM2657 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2657 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2657 precursor RNA is designated SEQ ID:2643, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2643 is located at position 7993 relative to the genome of Potato Virus A.

[89464] VGAM2657 precursor RNA folds onto itself, forming VGAM2657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89465] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2657 folded precursor RNA into VGAM2657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2657 RNA is designated SEQ ID:5368, and is provided hereinbelow with reference to the sequence listing part.

[89466] VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2657 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89467] VGAM2657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2657 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[89468] The complementary binding of VGAM2657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2657 host target RNA into VGAM2657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89469] It is appreciated that VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2657 host target genes. The mRNA of each one of this plurality of VGAM2657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2657 RNA, herein designated VGAM RNA, and which when bound by VGAM2657 RNA causes inhibition of translation of respective one or more VGAM2657 host target proteins.

[89470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2657 gene, herein designated VGAM GENE, on one

or more VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89471] It is yet further appreciated that a function of VGAM2657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2657 correlate with, and may be deduced from, the identity of the host target genes which VGAM2657 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89472] Nucleotide sequences of the VGAM2657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2657 are further described hereinbelow with reference to Table 1.

[89473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2657 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89474] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2657 gene, herein designated VGAM is inhibition of expression of VGAM2657 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2657 correlate with, and may be deduced from, the identity of the target genes which VGAM2657 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89475] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member

3 (ABCC3, Accession NM_020038) is a VGAM2657 host target gene. ABCC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC3 BINDING SITE, designated SEQ ID:21292, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89476] A function of VGAM2657 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM_020038), a gene which may act as an inducible transporter in the biliary and intestinal excretion of organic anions. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC3. The function of ABCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM505.Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408) is another VGAM2657 host target gene.

CELSR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELSR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR2 BINDING SITE, designated SEQ ID:7107, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89477] Another function of VGAM2657 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR2. The function of CELSR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432.FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003) is another VGAM2657 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22548, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89478] Another function of VGAM2657 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD6. Hepatocyte Nuclear Factor 4, Alpha (HNF4A, Accession NM_000457) is another VGAM2657 host target gene. HNF4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNF4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNF4A BINDING SITE, designated SEQ ID:6072, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89479] Another function of VGAM2657 is therefore inhibition of Hepatocyte Nuclear Factor 4, Alpha (HNF4A, Accession NM_000457), a gene which may be essential for development of the liver, kidney, pancreas and intestine. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNF4A. The function of HNF4A has been established by previous studies. Stoffel and Duncan (1997) investigated the molecular mechanism by which the Q268X mutation, which deletes 187 C-terminal amino acids of the HNF4-alpha protein, causes diabetes. They showed that the mutant gene product had lost its transcriptional transactivation activity and failed to dimerize and bind DNA, implying that the MODY1 phenotype is due to a loss of HFN4-alpha function. The effect of loss of function on expression of HNF4-alpha target genes was investigated further in embryonic stem cells, which are amenable to genetic manipulation and can be induced to form visceral endoderm. Because the visceral endoderm shares many properties with the liver and pancreatic beta-cells, including expression of genes for glucose transport and metabolism, it offers an ideal system to investigate HNF4-dependent gene regulation in glucose homeostasis.

With this approach, Stoffel and Duncan (1997) identified several genes encoding components of the glucose-dependent insulin secretion pathway whose expression is dependent upon HNF4-alpha. These included glucose transporter 2 (OMIM Ref. No. 138160), and the glycolytic enzymes aldolase B (OMIM Ref. No. 229600) and glyceraldehyde-3-phosphate dehydrogenase (OMIM Ref. No. 138400), and liver pyruvate kinase (OMIM Ref. No. 266200). In addition, they found that expression of the fatty acid binding proteins and cellular retinol binding protein also are downregulated in the absence of HNF4-alpha. These data provided direct evidence that HNF4-alpha is critical for regulating glucose transport and glycolysis and in doing so is critical for maintaining glucose homeostasis. Animal model experiments lend further support to the function of HNF4A. To study the contribution of HNF4A to hepatic development and differentiation, Li et al. (2000) used a technique in which Hnf4a -/- mouse embryos were complemented with wildtype visceral endoderm to counteract early embryonic lethality. By histologic analyses, the authors found that specification and early development of the liver and liver morphology did not require Hnf4a. In addition, the expression of many

liver genes was unaffected in these mice. However, RT-PCR analysis showed that Hnf4a -/- fetal livers failed to express a large array of genes whose expression in differentiated hepatocytes is essential for a functional hepatic parenchyma, including apolipoproteins (e.g., APOA1; 107680), metabolic proteins (e.g., aldolase B; 229600), transferrin (OMIM Ref. No. 190000), retinol-binding protein (e.g., RBP4; 180250), and erythropoietin (OMIM Ref. No. 133170). The lack of Hnf4a did not affect the expression of most transcription factors but did significantly reduce the levels of Hnf1a (TCF1; 142410) and the pregnane X receptor (NR1I2; 603065), suggesting that HNF4A acts upstream of at least these 2 transcription factors, which are also important in hepatocyte gene expression.

[89480] It is appreciated that the abovementioned animal model for HNF4A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[89481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[89482] Li, J.; Ning, G.; Duncan, S. A. : Mammalian hepatocyte differentiation requires the transcription factor HNF-4-alpha.

Genes Dev. 14: 464-474, 2000. ; and

[89483] Stoffel, M.; Duncan, S. A. : The maturity-onset diabetes of the young (MODY1) transcription factor HNF4-alpha regulates expression of genes required for glucose transport and metabolism. P.

[89484] Further studies establishing the function and utilities of HNF4A are found in John Hopkins OMIM database record ID 600281, and in sited publications numbered 4979, 9869-9871, 11607, 12032-9875, 12033-12034, 987 and 12035-9878 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Neural Retina Leucine Zipper (NRL, Accession NM_006177) is another VGAM2657 host target gene. NRL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRL BINDING SITE, designated SEQ ID:12838, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89485] Another function of VGAM2657 is therefore inhibition of Neural Retina Leucine Zipper (NRL, Accession

NM_006177), a gene which has a basic motif and a leucine zipper domain similar to jun and fos. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRL. The function of NRL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.PACE (Accession NM_002569) is another VGAM2657 host target gene. PACE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PACE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE, designated SEQ ID:8422, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89486] Another function of VGAM2657 is therefore inhibition of PACE (Accession NM_002569), a gene which processes pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM151.RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134423) is another VGAM2657 host target gene. RAD52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAD52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE, designated SEQ ID:28658, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89487] Another function of VGAM2657 is therefore inhibition of RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134423). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. Regulating Synaptic Membrane Exocytosis 1 (RIMS1, Accession XM_052206) is another VGAM2657 host target gene. RIMS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RIMS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIMS1 BINDING SITE, designated SEQ ID:35957, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89488] Another function of VGAM2657 is therefore inhibition of Regulating Synaptic Membrane Exocytosis 1 (RIMS1, Accession XM_052206), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIMS1. The function of RIMS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2454.Ribonuclease/angiogenin Inhibitor (RNH, Accession XM_006139) is another VGAM2657 host target gene. RNH BINDING SITE1 and RNH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNH BINDING SITE1 and

RNH BINDING SITE2, designated SEQ ID:29993 and SEQ ID:8844 respectively, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89489] Another function of VGAM2657 is therefore inhibition of Ribonuclease/angiogenin Inhibitor (RNH, Accession XM_006139), a gene which is an inhibitor of pancreatic rnase and angiogenin. may also function in the modulation of cellular activities. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNH. The function of RNH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM484.Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 7 (SLC7A7, Accession NM_003982) is another VGAM2657 host target gene. SLC7A7 BINDING SITE1 and SLC7A7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC7A7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A7 BINDING

SITE1 and SLC7A7 BINDING SITE2, designated SEQ ID:10122 and SEQ ID:43809 respectively, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89490] Another function of VGAM2657 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 7 (SLC7A7, Accession NM_003982). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A7. FLJ22814 (Accession NM_024916) is another VGAM2657 host target gene. FLJ22814 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:24443, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89491] Another function of VGAM2657 is therefore inhibition of FLJ22814 (Accession NM_024916). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22814. FLJ23416 (Accession NM_032238) is another VGAM2657 host target gene. FLJ23416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23416 BINDING SITE, designated SEQ ID:25960, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89492] Another function of VGAM2657 is therefore inhibition of FLJ23416 (Accession NM_032238). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23416. FLJ23519 (Accession XM_044932) is another VGAM2657 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:34307, to the nucleotide

sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89493] Another function of VGAM2657 is therefore inhibition of FLJ23519 (Accession XM_044932). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. Potassium Voltage-gated Channel, Subfamily G, Member 3 (KCNG3, Accession NM_133329) is another VGAM2657 host target gene. KCNG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNG3 BINDING SITE, designated SEQ ID:28437, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89494] Another function of VGAM2657 is therefore inhibition of Potassium Voltage-gated Channel, Subfamily G, Member 3 (KCNG3, Accession NM_133329). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNG3. KIAA1464 (Accession XM_043069) is another VGAM2657

host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33879, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89495] Another function of VGAM2657 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. KIAA1674 (Accession XM_044065) is another VGAM2657 host target gene. KIAA1674 BINDING SITE1 through KIAA1674 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1674, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE1 through KIAA1674 BINDING SITE6, designated SEQ ID:34104, SEQ ID:34105, SEQ ID:34106, SEQ ID:34107, SEQ ID:34108

and SEQ ID:34109 respectively, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89496] Another function of VGAM2657 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. MGC2474 (Accession NM_023931) is another VGAM2657 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23415, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89497] Another function of VGAM2657 is therefore inhibition of MGC2474 (Accession NM_023931). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. MGC3047 (Accession NM_032348) is another VGAM2657 host target gene. MGC3047 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3047 BINDING SITE, designated SEQ ID:26138, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89498] Another function of VGAM2657 is therefore inhibition of MGC3047 (Accession NM_032348). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3047. MGC5391 (Accession NM_032740) is another VGAM2657 host target gene. MGC5391 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5391 BINDING SITE, designated SEQ ID:26471, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89499] Another function of VGAM2657 is therefore inhibition of

MGC5391 (Accession NM_032740). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5391. NIFU (Accession XM_041081) is another VGAM2657 host target gene. NIFU BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NIFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIFU BINDING SITE, designated SEQ ID:33436, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89500] Another function of VGAM2657 is therefore inhibition of NIFU (Accession XM_041081). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIFU. Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654) is another VGAM2657 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16091, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89501] Another function of VGAM2657 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM2657 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45771, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89502] Another function of VGAM2657 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with TOB2. LOC142927 (Accession XM_084380) is another VGAM2657 host target gene. LOC142927 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:37569, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89503] Another function of VGAM2657 is therefore inhibition of LOC142927 (Accession XM_084380). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142927. LOC144571 (Accession XM_096630) is another VGAM2657 host target gene. LOC144571 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144571 BINDING SITE, designated SEQ ID:40444, to

the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89504] Another function of VGAM2657 is therefore inhibition of LOC144571 (Accession XM_096630). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144571. LOC145195 (Accession XM_096731) is another VGAM2657 host target gene. LOC145195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145195 BINDING SITE, designated SEQ ID:40512, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89505] Another function of VGAM2657 is therefore inhibition of LOC145195 (Accession XM_096731). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145195. LOC146782 (Accession XM_083963) is another VGAM2657 host target gene. LOC146782 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC146782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146782 BINDING SITE, designated SEQ ID:37524, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89506] Another function of VGAM2657 is therefore inhibition of LOC146782 (Accession XM_083963). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146782. LOC148709 (Accession XM_086281) is another VGAM2657 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38579, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89507] Another function of VGAM2657 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities

of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC149478 (Accession XM_086536) is another VGAM2657 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:38753, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89508] Another function of VGAM2657 is therefore inhibition of LOC149478 (Accession XM_086536). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC170395 (Accession XM_084325) is another VGAM2657 host target gene. LOC170395 BINDING SITE1 through LOC170395 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC170395, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC170395 BINDING SITE1 through LOC170395 BINDING SITE3, designated SEQ ID:37543, SEQ ID:37541 and SEQ ID:37542 respectively, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89509] Another function of VGAM2657 is therefore inhibition of LOC170395 (Accession XM_084325). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170395. LOC256158 (Accession XM_175125) is another VGAM2657 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46634, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89510] Another function of VGAM2657 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256158. LOC257054 (Accession XM_171010) is another VGAM2657 host target gene. LOC257054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE, designated SEQ ID:45782, to the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, also designated SEQ ID:5368.

[89511] Another function of VGAM2657 is therefore inhibition of LOC257054 (Accession XM_171010). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257054. LOC90019 (Accession NM_138567) is another VGAM2657 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90019 BINDING SITE, designated SEQ ID:28877, to the nucleotide sequence of VGAM2657 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5368.

[89512] Another function of VGAM2657 is therefore inhibition of LOC90019 (Accession NM_138567). Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90019. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2658 (VGAM2658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89513] VGAM2658 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2658 was detected is described hereinabove with reference to Figs. 1-8.

[89514] VGAM2658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89515] VGAM2658 gene encodes a VGAM2658 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2658 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2658 precursor RNA is designated SEQ ID:2644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2644 is located at position 8772 relative to the genome of Potato Virus A.

[89516] VGAM2658 precursor RNA folds onto itself, forming VGAM2658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89517] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2658 folded precursor RNA into VGAM2658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2658 RNA is designated SEQ ID:5369, and is provided hereinbelow with reference to the sequence listing part.

[89518] VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2658 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89519] VGAM2658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2658 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89520] The complementary binding of VGAM2658 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2658 host target RNA into VGAM2658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89521] It is appreciated that VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2658 host target genes. The mRNA of

each one of this plurality of VGAM2658 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2658 RNA, herein designated VGAM RNA, and which when bound by VGAM2658 RNA causes inhibition of translation of respective one or more VGAM2658 host target proteins.

[89522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2658 gene, herein designated VGAM GENE, on one or more VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[89523] It is yet further appreciated that a function of VGAM2658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2658 correlate with, and may be deduced from, the identity of the host target genes which VGAM2658 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89524] Nucleotide sequences of the VGAM2658 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2658 are further described hereinbelow with reference to Table 1.

[89525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2658 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2658 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89526] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2658 gene, herein designated VGAM is inhibition of expression of VGAM2658 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2658 correlate with, and may be deduced from, the identity of the target genes which VGAM2658 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89527] Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM_002140) is a VGAM2658 host target gene. HNRPK BINDING SITE1 and HNRPK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPK BINDING SITE1 and HNRPK BINDING SITE2, designated SEQ ID:7918 and SEQ ID:25282 respectively, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89528] A function of VGAM2658 is therefore inhibition of Hetero-

geneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM_002140), a gene which play a role in the nuclear metabolism of hnrnas, particularly for pre-mrnas that contain cytidine-rich sequence. Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPK. The function of HNRPK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Ribulose-5-phosphate-3-epimerase (RPE, Accession XM_030834) is another VGAM2658 host target gene. RPE BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RPE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE, designated SEQ ID:31157, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89529] Another function of VGAM2658 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession XM_030834). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RPE. Chromosome 20 Open Reading Frame 140 (C20orf140, Accession NM_144628) is another VGAM2658 host target gene. C20orf140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf140 BINDING SITE, designated SEQ ID:29444, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89530] Another function of VGAM2658 is therefore inhibition of Chromosome 20 Open Reading Frame 140 (C20orf140, Accession NM_144628). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf140. CCR4-NOT Transcription Complex, Subunit 4 (CNOT4, Accession NM_013316) is another VGAM2658 host target gene. CNOT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CNOT4 BINDING SITE, designated SEQ ID:14965, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89531] Another function of VGAM2658 is therefore inhibition of CCR4-NOT Transcription Complex, Subunit 4 (CNOT4, Accession NM_013316). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT4. KIAA1348 (Accession XM_043826) is another VGAM2658 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34031, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89532] Another function of VGAM2658 is therefore inhibition of KIAA1348 (Accession XM_043826). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1348. KIAA1577 (Accession XM_035299) is another VGAM2658 host target gene. KIAA1577 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:32210, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89533] Another function of VGAM2658 is therefore inhibition of KIAA1577 (Accession XM_035299). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577. MGC2835 (Accession NM_024072) is another VGAM2658 host target gene. MGC2835 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2835 BINDING SITE, designated SEQ ID:23504, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM

RNA, also designated SEQ ID:5369.

[89534] Another function of VGAM2658 is therefore inhibition of MGC2835 (Accession NM_024072). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2835. LOC146823 (Accession XM_097105) is another VGAM2658 host target gene. LOC146823 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146823 BINDING SITE, designated SEQ ID:40751, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89535] Another function of VGAM2658 is therefore inhibition of LOC146823 (Accession XM_097105). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146823. LOC149302 (Accession XM_086489) is another VGAM2658 host target gene. LOC149302 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149302, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:38704, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89536] Another function of VGAM2658 is therefore inhibition of LOC149302 (Accession XM_086489). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149302. LOC164397 (Accession XM_092780) is another VGAM2658 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40154, to the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, also designated SEQ ID:5369.

[89537] Another function of VGAM2658 is therefore inhibition of LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM2658 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC164397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2659 (VGAM2659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89538] VGAM2659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2659 was detected is described hereinabove with reference to Figs. 1-8.

[89539] VGAM2659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89540] VGAM2659 gene encodes a VGAM2659 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2659 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2659 precursor RNA is desig-

nated SEQ ID:2645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2645 is located at position 3436 relative to the genome of Potato Virus A.

[89541] VGAM2659 precursor RNA folds onto itself, forming VGAM2659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89542] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2659 folded precursor RNA into VGAM2659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2659 RNA is designated SEQ ID:5370, and is provided hereinbelow with reference to the sequence

listing part.

[89543] VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2659 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89544] VGAM2659 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2659 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2659 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89545] The complementary binding of VGAM2659 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2659 host target RNA into VGAM2659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89546] It is appreciated that VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2659 host target genes. The mRNA of each one of this plurality of VGAM2659 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2659 RNA, herein designated VGAM

RNA, and which when bound by VGAM2659 RNA causes inhibition of translation of respective one or more VGAM2659 host target proteins.

[89547] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2659 gene, herein designated VGAM GENE, on one or more VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89548] It is yet further appreciated that a function of VGAM2659 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2659 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2659 correlate with, and may be deduced from, the identity of the host target genes which VGAM2659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89549] Nucleotide sequences of the VGAM2659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2659 are further described hereinbelow with reference to Table 1.

[89550] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2659 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89551] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2659 gene, herein designated VGAM is

inhibition of expression of VGAM2659 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2659 correlate with, and may be deduced from, the identity of the target genes which VGAM2659 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89552] Aldehyde Dehydrogenase 3 Family, Member B1 (ALDH3B1, Accession XM_166190) is a VGAM2659 host target gene. ALDH3B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH3B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3B1 BINDING SITE, designated SEQ ID:44001, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89553] A function of VGAM2659 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member B1 (ALDH3B1, Accession XM_166190), a gene which may play a major role in the detoxification of aldehydes generated by alcohol metabolism and lipid peroxidation. Accordingly, utilities of VGAM2659 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with ALDH3B1. The function of ALDH3B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2007.AT-binding Transcription Factor 1 (ATBF1, Accession NM_006885) is another VGAM2659 host target gene. ATBF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATBF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATBF1 BINDING SITE, designated SEQ ID:13750, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89554] Another function of VGAM2659 is therefore inhibition of AT-binding Transcription Factor 1 (ATBF1, Accession NM_006885). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATBF1. Axin 1 (AXIN1, Accession XM_027520) is another VGAM2659 host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30519, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89555] Another function of VGAM2659 is therefore inhibition of Axin 1 (AXIN1, Accession XM_027520). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326) is another VGAM2659 host target gene. BCL9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL9 BINDING SITE, designated SEQ ID:10526, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89556] Another function of VGAM2659 is therefore inhibition of B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326), a

gene which recruits of PYGO to the nuclear beta-catenin-TCF complex in Wnt/Wingless signaling. Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL9. The function of BCL9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Cleavage and Polyadenylation Specific Factor 6, 68kDa (CPSF6, Accession NM_007007) is another VGAM2659 host target gene. CPSF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPSF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF6 BINDING SITE, designated SEQ ID:13870, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89557] Another function of VGAM2659 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 6, 68kDa (CPSF6, Accession NM_007007). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF6.

POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237) is another VGAM2659 host target gene. POU4F1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12899, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89558] Another function of VGAM2659 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function of POU4F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026.SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107) is another VGAM2659 host target

gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9078, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89559] Another function of VGAM2659 is therefore inhibition of SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaaag-3' motif. Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409.T-cell Leukemia, Homeobox 1 (TLX1, Accession NM_005521) is another VGAM2659 host target gene. TLX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TLX1 BINDING SITE, designated SEQ ID:12047, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89560] Another function of VGAM2659 is therefore inhibition of T-cell Leukemia, Homeobox 1 (TLX1, Accession NM_005521), a gene which controls the spleen development. Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLX1. The function of TLX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1505.Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709) is another VGAM2659 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11057, to the nucleotide sequence of VGAM2659 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5370.

[89561] Another function of VGAM2659 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. DC-TM4F2 (Accession NM_030927) is another VGAM2659 host target gene. DC-TM4F2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DC-TM4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:25200, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89562] Another function of VGAM2659 is therefore inhibition of DC-TM4F2 (Accession NM_030927). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC-TM4F2. DKFZP566N034 (Accession XM_087115) is another VGAM2659 host target gene. DKFZP566N034 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by DKFZP566N034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566N034 BINDING SITE, designated SEQ ID:39064, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89563] Another function of VGAM2659 is therefore inhibition of DKFZP566N034 (Accession XM_087115). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566N034. FLJ10597 (Accession NM_018150) is another VGAM2659 host target gene. FLJ10597 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10597 BINDING SITE, designated SEQ ID:19954, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89564] Another function of VGAM2659 is therefore inhibition of

FLJ10597 (Accession NM_018150). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10597. FLJ12687 (Accession NM_024917) is another VGAM2659 host target gene. FLJ12687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12687 BINDING SITE, designated SEQ ID:24449, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89565] Another function of VGAM2659 is therefore inhibition of FLJ12687 (Accession NM_024917). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12687. FLJ23323 (Accession NM_024654) is another VGAM2659 host target gene. FLJ23323 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ23323 BINDING SITE, designated SEQ ID:23956, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89566] Another function of VGAM2659 is therefore inhibition of FLJ23323 (Accession NM_024654). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23323. FLJ23399 (Accession NM_022763) is another VGAM2659 host target gene. FLJ23399 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23399 BINDING SITE, designated SEQ ID:23009, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89567] Another function of VGAM2659 is therefore inhibition of FLJ23399 (Accession NM_022763). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23399. Golgi Phosphoprotein 3 (coat-protein)

(GOLPH3, Accession NM_022130) is another VGAM2659 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:22688, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89568] Another function of VGAM2659 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. KIAA1130 (Accession XM_031104) is another VGAM2659 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31288, to the nucleotide sequence of VGAM2659

RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89569] Another function of VGAM2659 is therefore inhibition of KIAA1130 (Accession XM_031104). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1287 (Accession XM_085753) is another VGAM2659 host target gene. KIAA1287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1287 BINDING SITE, designated SEQ ID:38326, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89570] Another function of VGAM2659 is therefore inhibition of KIAA1287 (Accession XM_085753). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1287. KIAA1434 (Accession XM_045585) is another VGAM2659 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34492, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89571] Another function of VGAM2659 is therefore inhibition of KIAA1434 (Accession XM_045585). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1434. KIAA1493 (Accession XM_034415) is another VGAM2659 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32088, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89572] Another function of VGAM2659 is therefore inhibition of KIAA1493 (Accession XM_034415). Accordingly, utilities

of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. MGC11352 (Accession XM_035941) is another VGAM2659 host target gene. MGC11352 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11352 BINDING SITE, designated SEQ ID:32358, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89573] Another function of VGAM2659 is therefore inhibition of MGC11352 (Accession XM_035941). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11352. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM2659 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30690, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89574] Another function of VGAM2659 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. Scavenger Receptor Cysteine Rich Domain Containing, Group B (4 domains) (SRCRB4D, Accession NM_080744) is another VGAM2659 host target gene. SRCRB4D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRCRB4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRCRB4D BINDING SITE, designated SEQ ID:28029, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89575] Another function of VGAM2659 is therefore inhibition of Scavenger Receptor Cysteine Rich Domain Containing, Group B (4 domains) (SRCRB4D, Accession NM_080744).

Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRCRB4D. LOC112616 (Accession NM_138410) is another VGAM2659 host target gene. LOC112616 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112616, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112616 BINDING SITE, designated SEQ ID:28774, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89576] Another function of VGAM2659 is therefore inhibition of LOC112616 (Accession NM_138410). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112616. LOC135763 (Accession NM_138572) is another VGAM2659 host target gene. LOC135763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:28885, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89577] Another function of VGAM2659 is therefore inhibition of LOC135763 (Accession NM_138572). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763. LOC150279 (Accession XM_086820) is another VGAM2659 host target gene. LOC150279 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150279 BINDING SITE, designated SEQ ID:38900, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89578] Another function of VGAM2659 is therefore inhibition of LOC150279 (Accession XM_086820). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150279. LOC151516 (Accession XM_087229) is an-

other VGAM2659 host target gene. LOC151516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151516 BINDING SITE, designated SEQ ID:39129, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89579] Another function of VGAM2659 is therefore inhibition of LOC151516 (Accession XM_087229). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151516. LOC152215 (Accession XM_087407) is another VGAM2659 host target gene. LOC152215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152215 BINDING SITE, designated SEQ ID:39225, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89580] Another function of VGAM2659 is therefore inhibition of LOC152215 (Accession XM_087407). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152215. LOC152313 (Accession XM_098190) is another VGAM2659 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41475, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89581] Another function of VGAM2659 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC158434 (Accession XM_098939) is another VGAM2659 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41990, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89582] Another function of VGAM2659 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC167147 (Accession XM_094310) is another VGAM2659 host target gene. LOC167147 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC167147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC167147 BINDING SITE, designated SEQ ID:40227, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89583] Another function of VGAM2659 is therefore inhibition of LOC167147 (Accession XM_094310). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC167147. LOC220776 (Accession XM_043388) is another VGAM2659 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33940, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89584] Another function of VGAM2659 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC221002 (Accession XM_166156) is another VGAM2659 host target gene. LOC221002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221002 BINDING SITE, designated SEQ ID:43973, to the nucleotide sequence of VGAM2659 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5370.

[89585] Another function of VGAM2659 is therefore inhibition of LOC221002 (Accession XM_166156). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221002. LOC221935 (Accession XM_166537) is another VGAM2659 host target gene. LOC221935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44502, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89586] Another function of VGAM2659 is therefore inhibition of LOC221935 (Accession XM_166537). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC254228 (Accession XM_171123) is another VGAM2659 host target gene. LOC254228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254228, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45922, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89587] Another function of VGAM2659 is therefore inhibition of LOC254228 (Accession XM_171123). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254228. LOC255645 (Accession XM_172967) is another VGAM2659 host target gene. LOC255645 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255645 BINDING SITE, designated SEQ ID:46220, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89588] Another function of VGAM2659 is therefore inhibition of LOC255645 (Accession XM_172967). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255645. LOC51619 (Accession NM_015983) is another VGAM2659 host target gene. LOC51619 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51619 BINDING SITE, designated SEQ ID:18079, to the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89589] Another function of VGAM2659 is therefore inhibition of LOC51619 (Accession NM_015983). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51619. LOC92573 (Accession XM_045884) is another VGAM2659 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34597, to the

nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, also designated SEQ ID:5370.

[89590] Another function of VGAM2659 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2660 (VGAM2660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89591] VGAM2660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2660 was detected is described hereinabove with reference to Figs. 1-8.

[89592] VGAM2660 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A.
VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89593] VGAM2660 gene encodes a VGAM2660 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2660 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2660 precursor RNA is designated SEQ ID:2646, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2646 is located at position 4281 relative to the genome of Potato Virus A.

[89594] VGAM2660 precursor RNA folds onto itself, forming VGAM2660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89595] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2660 folded precursor RNA into VGAM2660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2660 RNA is designated SEQ ID:5371, and is provided hereinbelow with reference to the sequence listing part.

[89596] VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2660 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89597] VGAM2660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2660 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89598] The complementary binding of VGAM2660 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2660 host target RNA into VGAM2660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89599] It is appreciated that VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2660 host target genes. The mRNA of each one of this plurality of VGAM2660 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2660 RNA, herein designated VGAM RNA, and which when bound by VGAM2660 RNA causes inhibition of translation of respective one or more VGAM2660 host target proteins.

[89600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2660 gene, herein designated VGAM GENE, on one or more VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89601] It is yet further appreciated that a function of VGAM2660 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2660 correlate with, and may be deduced from, the identity of the host target genes which VGAM2660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89602] Nucleotide sequences of the VGAM2660 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2660 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2660 are further described hereinbelow with reference to Table 1.

[89603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2660 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2660 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89604] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2660 gene, herein designated VGAM is inhibition of expression of VGAM2660 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2660 correlate with, and may be deduced from, the identity of the target genes which VGAM2660 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89605] Aquaporin 1 (channel-forming integral protein, 28kDa) (AQP1, Accession NM_000385) is a VGAM2660 host target gene. AQP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AQP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP1 BINDING SITE, designated SEQ ID:5959, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89606] A function of VGAM2660 is therefore inhibition of Aquaporin 1 (channel-forming integral protein, 28kDa) (AQP1,

Accession NM_000385). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP1. Dihydrolipoamide S-succinyltransferase (E2 component of 2-oxo-glutarate complex) (DLST, Accession NM_001933) is another VGAM2660 host target gene. DLST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLST BINDING SITE, designated SEQ ID:7644, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89607] Another function of VGAM2660 is therefore inhibition of Dihydrolipoamide S-succinyltransferase (E2 component of 2-oxo-glutarate complex) (DLST, Accession NM_001933), a gene which catalyzes the oxidative decarboxylation of alpha-keto acids. Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLST. The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM656.Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM_006730) is another VGAM2660 host target gene. DNASE1L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DNASE1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1L1 BINDING SITE, designated SEQ ID:13569, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89608] Another function of VGAM2660 is therefore inhibition of Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM_006730), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1L1. The function of DNASE1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885.Homeo Box D4 (HOXD4, Accession NM_014621) is another VGAM2660 host target gene.

HOXD4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:15980, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89609] Another function of VGAM2660 is therefore inhibition of Homeo Box D4 (HOXD4, Accession NM_014621), a gene which is part of a developmental regulatory system. Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD4. The function of HOXD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM330.Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622) is another VGAM2660 host target gene. LOH11CR2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOH11CR2A, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:15984, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89610] Another function of VGAM2660 is therefore inhibition of Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOH11CR2A. Chromosome 14 Open Reading Frame 4 (C14orf4, Accession XM_041104) is another VGAM2660 host target gene. C14orf4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C14orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf4 BINDING SITE, designated SEQ ID:33445, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89611] Another function of VGAM2660 is therefore inhibition of

Chromosome 14 Open Reading Frame 4 (C14orf4, Accession XM_041104). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf4. FLJ21791 (Accession XM_028958) is another VGAM2660 host target gene. FLJ21791 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21791 BINDING SITE, designated SEQ ID:30809, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89612] Another function of VGAM2660 is therefore inhibition of FLJ21791 (Accession XM_028958). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21791. KIAA0449 (Accession NM_017596) is another VGAM2660 host target gene. KIAA0449 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19052, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89613] Another function of VGAM2660 is therefore inhibition of KIAA0449 (Accession NM_017596). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0449. TUBB5 (Accession NM_006087) is another VGAM2660 host target gene. TUBB5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUBB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUBB5 BINDING SITE, designated SEQ ID:12731, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89614] Another function of VGAM2660 is therefore inhibition of TUBB5 (Accession NM_006087). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBB5.

LOC163782 (Accession XM_089138) is another VGAM2660 host target gene. LOC163782 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163782 BINDING SITE, designated SEQ ID:39965, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89615] Another function of VGAM2660 is therefore inhibition of LOC163782 (Accession XM_089138). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163782. LOC221922 (Accession XM_166555) is another VGAM2660 host target gene. LOC221922 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:44535, to the nucleotide sequence of VGAM2660 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5371.

[89616] Another function of VGAM2660 is therefore inhibition of LOC221922 (Accession XM_166555). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922. LOC254848 (Accession XM_173133) is another VGAM2660 host target gene. LOC254848 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254848 BINDING SITE, designated SEQ ID:46382, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89617] Another function of VGAM2660 is therefore inhibition of LOC254848 (Accession XM_173133). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254848. LOC255452 (Accession XM_174088) is another VGAM2660 host target gene. LOC255452 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255452, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46577, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89618] Another function of VGAM2660 is therefore inhibition of LOC255452 (Accession XM_174088). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. LOC93496 (Accession XM_051698) is another VGAM2660 host target gene. LOC93496 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93496 BINDING SITE, designated SEQ ID:35866, to the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, also designated SEQ ID:5371.

[89619] Another function of VGAM2660 is therefore inhibition of LOC93496 (Accession XM_051698). Accordingly, utilities of VGAM2660 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC93496. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2661 (VGAM2661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89620] VGAM2661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2661 was detected is described hereinabove with reference to Figs. 1-8.

[89621] VGAM2661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89622] VGAM2661 gene encodes a VGAM2661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2661 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2661 precursor RNA is desig-

nated SEQ ID:2647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2647 is located at position 2878 relative to the genome of Potato Virus A.

[89623] VGAM2661 precursor RNA folds onto itself, forming VGAM2661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89624] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2661 folded precursor RNA into VGAM2661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2661 RNA is designated SEQ ID:5372, and is provided hereinbelow with reference to the sequence

listing part.

[89625] VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2661 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89626] VGAM2661 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2661 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2661 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89627] The complementary binding of VGAM2661 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2661 host target RNA into VGAM2661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89628] It is appreciated that VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2661 host target genes. The mRNA of each one of this plurality of VGAM2661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2661 RNA, herein designated VGAM

RNA, and which when bound by VGAM2661 RNA causes inhibition of translation of respective one or more VGAM2661 host target proteins.

[89629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2661 gene, herein designated VGAM GENE, on one or more VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89630] It is yet further appreciated that a function of VGAM2661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2661 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2661 correlate with, and may be deduced from, the identity of the host target genes which VGAM2661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89631] Nucleotide sequences of the VGAM2661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2661 are further described hereinbelow with reference to Table 1.

[89632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2661 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89633] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2661 gene, herein designated VGAM is

inhibition of expression of VGAM2661 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2661 correlate with, and may be deduced from, the identity of the target genes which VGAM2661 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89634] Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132) is a VGAM2661 host target gene. F8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5618, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89635] A function of VGAM2661 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. DKFZP434L187 (Accession XM_044070) is another

VGAM2661 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34120, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89636] Another function of VGAM2661 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ13262 (Accession NM_024914) is another VGAM2661 host target gene. FLJ13262 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13262 BINDING SITE, designated SEQ ID:24431, to the nucleotide sequence of VGAM2661 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5372.

[89637] Another function of VGAM2661 is therefore inhibition of FLJ13262 (Accession NM_024914). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13262. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758) is another VGAM2661 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ ID:12324, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89638] Another function of VGAM2661 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA3. KIAA1437 (Accession XM_026998) is another VGAM2661 host target gene. KIAA1437 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1437 BINDING SITE, designated SEQ ID:30383, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89639] Another function of VGAM2661 is therefore inhibition of KIAA1437 (Accession XM_026998). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1437. Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM_004716) is another VGAM2661 host target gene. PCSK7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK7 BINDING SITE, designated SEQ ID:11074, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89640] Another function of VGAM2661 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM_004716). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK7. LOC129676 (Accession XM_065341) is another VGAM2661 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37283, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89641] Another function of VGAM2661 is therefore inhibition of LOC129676 (Accession XM_065341). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC148918 (Accession XM_086361) is another VGAM2661 host target gene. LOC148918 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148918, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148918 BINDING SITE, designated SEQ ID:38613, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89642] Another function of VGAM2661 is therefore inhibition of LOC148918 (Accession XM_086361). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148918. LOC164832 (Accession XM_092184) is another VGAM2661 host target gene. LOC164832 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164832 BINDING SITE, designated SEQ ID:40110, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89643] Another function of VGAM2661 is therefore inhibition of LOC164832 (Accession XM_092184). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC164832. LOC220988 (Accession XM_165561) is another VGAM2661 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:43684, to the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, also designated SEQ ID:5372.

[89644] Another function of VGAM2661 is therefore inhibition of LOC220988 (Accession XM_165561). Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2662 (VGAM2662) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89645] VGAM2662 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2662 was detected is described hereinabove with reference to Figs. 1-8.

[89646] VGAM2662 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89647] VGAM2662 gene encodes a VGAM2662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2662 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2662 precursor RNA is designated SEQ ID:2648, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2648 is located at position 4423 relative to the genome of Potato Virus A.

[89648] VGAM2662 precursor RNA folds onto itself, forming VGAM2662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89649] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2662 folded precursor RNA into VGAM2662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM2662 RNA is designated SEQ ID:5373, and is provided hereinbelow with reference to the sequence listing part.

[89650] VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2662 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89651] VGAM2662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2662 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2662 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89652] The complementary binding of VGAM2662 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2662 host target RNA into VGAM2662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89653] It is appreciated that VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2662 host target genes. The mRNA of each one of this plurality of VGAM2662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2662 RNA, herein designated VGAM RNA, and which when bound by VGAM2662 RNA causes inhibition of translation of respective one or more VGAM2662 host target proteins.

[89654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2662 gene, herein designated VGAM GENE, on one or more VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89655] It is yet further appreciated that a function of VGAM2662 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2662 correlate with, and may be deduced from, the identity of the host target genes which VGAM2662 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89656] Nucleotide sequences of the VGAM2662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2662 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2662 are further described hereinbelow with reference to Table 1.

[89657] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2662 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89658] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2662 gene, herein designated VGAM is inhibition of expression of VGAM2662 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2662 correlate with, and may be deduced from, the identity of the target genes which VGAM2662 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89659] Dihydropyrimidinase-like 3 (DPYSL3, Accession NM_001387) is a VGAM2662 host target gene. DPYSL3 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by DPYSL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL3 BINDING SITE, designated SEQ ID:7073, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89660] A function of VGAM2662 is therefore inhibition of Dihydropyrimidinase-like 3 (DPYSL3, Accession NM_001387), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL3. The function of DPYSL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24.Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190) is another VGAM2662 host target gene. FANCC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FANCC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FANCC BINDING SITE, designated SEQ ID:34905, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89661] Another function of VGAM2662 is therefore inhibition of Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCC. FLJ13055 (Accession NM_022737) is another VGAM2662 host target gene. FLJ13055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13055 BINDING SITE, designated SEQ ID:22943, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89662] Another function of VGAM2662 is therefore inhibition of FLJ13055 (Accession NM_022737). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13055. KIAA0352 (Accession NM_014830) is another VGAM2662 host target gene. KIAA0352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0352 BINDING SITE, designated SEQ ID:16823, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89663] Another function of VGAM2662 is therefore inhibition of KIAA0352 (Accession NM_014830). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0352. KIAA1136 (Accession XM_166110) is another VGAM2662 host target gene. KIAA1136 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1136 BINDING SITE, designated SEQ ID:43884, to the nucleotide sequence of VGAM2662 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5373.

[89664] Another function of VGAM2662 is therefore inhibition of KIAA1136 (Accession XM_166110). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1136. KR18 (Accession NM_033288) is another VGAM2662 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27116, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89665] Another function of VGAM2662 is therefore inhibition of KR18 (Accession NM_033288). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. MGC16386 (Accession NM_080668) is another VGAM2662 host target gene. MGC16386 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16386, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16386 BINDING SITE, designated SEQ ID:27958, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89666] Another function of VGAM2662 is therefore inhibition of MGC16386 (Accession NM_080668). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16386. Phosphatidylserine Decarboxylase (PISD, Accession NM_014338) is another VGAM2662 host target gene. PISD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PISD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PISD BINDING SITE, designated SEQ ID:15654, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89667] Another function of VGAM2662 is therefore inhibition of Phosphatidylserine Decarboxylase (PISD, Accession NM_014338). Accordingly, utilities of VGAM2662 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PISD. TA-PP2C (Accession NM_139283) is another VGAM2662 host target gene. TA-PP2C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TA-PP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-PP2C BINDING SITE, designated SEQ ID:29281, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89668] Another function of VGAM2662 is therefore inhibition of TA-PP2C (Accession NM_139283). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-PP2C. LOC136288 (Accession XM_059832) is another VGAM2662 host target gene. LOC136288 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC136288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC136288 BINDING SITE, designated SEQ ID:37100, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89669] Another function of VGAM2662 is therefore inhibition of LOC136288 (Accession XM_059832). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136288. LOC203392 (Accession XM_114696) is another VGAM2662 host target gene. LOC203392 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203392 BINDING SITE, designated SEQ ID:43042, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89670] Another function of VGAM2662 is therefore inhibition of LOC203392 (Accession XM_114696). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203392. LOC64116 (Accession NM_022154) is another VGAM2662 host target gene. LOC64116 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC64116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64116 BINDING SITE, designated SEQ ID:22713, to the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, also designated SEQ ID:5373.

[89671] Another function of VGAM2662 is therefore inhibition of LOC64116 (Accession NM_022154). Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64116. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2663 (VGAM2663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89672] VGAM2663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2663 was detected is described hereinabove with reference to Figs. 1-8.

[89673] VGAM2663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89674] VGAM2663 gene encodes a VGAM2663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2663 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2663 precursor RNA is designated SEQ ID:2649, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2649 is located at position 3193 relative to the genome of Potato Virus A.

[89675] VGAM2663 precursor RNA folds onto itself, forming VGAM2663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[89676] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2663 folded precursor RNA into VGAM2663 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2663 RNA is designated SEQ ID:5374, and is provided hereinbelow with reference to the sequence listing part.

[89677] VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2663 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89678] VGAM2663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2663 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2663 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89679] The complementary binding of VGAM2663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2663 host target RNA into VGAM2663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89680] It is appreciated that VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2663 host target genes. The mRNA of each one of this plurality of VGAM2663 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2663 RNA, herein designated VGAM RNA, and which when bound by VGAM2663 RNA causes inhibition of translation of respective one or more VGAM2663 host target proteins.

[89681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2663 gene, herein designated VGAM GENE, on one or more VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89682] It is yet further appreciated that a function of VGAM2663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2663 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM2663 correlate with, and may be deduced from, the identity of the host target genes which VGAM2663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89683] Nucleotide sequences of the VGAM2663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2663 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2663 are further described hereinbelow with reference to Table 1.

[89684] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2663 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2663 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89685] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2663 gene, herein designated VGAM is inhibition of expression of VGAM2663 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2663 correlate with, and may be deduced from, the identity of the target genes which VGAM2663 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89686] RAP1 (Accession NM_018975) is a VGAM2663 host target gene. RAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RAP1 BINDING SITE, designated SEQ ID:21045, to the nucleotide sequence of VGAM2663 RNA, herein designated VGAM RNA, also designated SEQ ID:5374.

[89687] A function of VGAM2663 is therefore inhibition of RAP1 (Accession NM_018975), a gene which is an ortholog of the yeast telomeric protein Rap1 and may be a general characteristic of sequence-specific transcriptional factors. Accordingly, utilities of VGAM2663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1. The function of RAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2083.FLJ22029 (Accession NM_024949) is another VGAM2663 host target gene. FLJ22029 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22029 BINDING SITE, designated SEQ ID:24505, to the nucleotide sequence of VGAM2663 RNA, herein designated VGAM RNA, also designated SEQ ID:5374.

[89688] Another function of VGAM2663 is therefore inhibition of FLJ22029 (Accession NM_024949). Accordingly, utilities of VGAM2663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22029. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2664 (VGAM2664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89689] VGAM2664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2664 was detected is described hereinabove with reference to Figs. 1-8.

[89690] VGAM2664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Parasitica Mitovirus 1-NB631. VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89691] VGAM2664 gene encodes a VGAM2664 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2664 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2664 precursor RNA is designated SEQ ID:2650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2650 is located at position 1630 relative to the genome of Cryphonectria Parasitica Mitovirus 1-NB631.

[89692] VGAM2664 precursor RNA folds onto itself, forming VGAM2664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89693] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2664 folded precursor RNA into VGAM2664 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2664 RNA is designated SEQ ID:5375, and is provided hereinbelow with reference to the sequence listing part.

[89694] VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2664 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89695] VGAM2664 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2664 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89696] The complementary binding of VGAM2664 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2664 host target RNA into VGAM2664 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89697] It is appreciated that VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2664 host target genes. The mRNA of each one of this plurality of VGAM2664 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2664 RNA, herein designated VGAM RNA, and which when bound by VGAM2664 RNA causes inhibition of translation of respective one or more VGAM2664 host target proteins.

[89698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2664 gene, herein designated VGAM GENE, on one or more VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89699] It is yet further appreciated that a function of VGAM2664 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of viral infection by Cryphonectria Parasitica Mitovirus 1-NB631. Specific functions, and accordingly utilities, of VGAM2664 correlate with, and may be deduced from, the identity of the host target genes which VGAM2664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89700] Nucleotide sequences of the VGAM2664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2664 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2664 are further described hereinbelow with reference to Table 1.

[89701] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2664 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2664 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[89702] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2664 gene, herein designated VGAM is inhibition of expression of VGAM2664 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2664 correlate with, and may be deduced from, the identity of the target genes which VGAM2664 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89703] Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM_012262) is a VGAM2664 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14580, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89704] A function of VGAM2664 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM_012262). Accordingly, utilities of VGAM2664 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Myotubularin Related Protein 2 (MTMR2, Accession NM_016156) is another VGAM2664 host target gene. MTMR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTMR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR2 BINDING SITE, designated SEQ ID:18245, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89705] Another function of VGAM2664 is therefore inhibition of Myotubularin Related Protein 2 (MTMR2, Accession NM_016156). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR2. Stress 70 Protein Chaperone, Microsome-associated, 60kDa (STCH, Accession NM_006948) is another VGAM2664 host target gene. STCH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of STCH BINDING SITE, designated SEQ ID:13833, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89706] Another function of VGAM2664 is therefore inhibition of Stress 70 Protein Chaperone, Microsome-associated, 60kDa (STCH, Accession NM_006948), a gene which has peptide-independent atpase activity. Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STCH. The function of STCH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM550.DKFZP761E2110 (Accession NM_030953) is another VGAM2664 host target gene. DKFZP761E2110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761E2110 BINDING SITE, designated SEQ ID:25225, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5375.

[89707] Another function of VGAM2664 is therefore inhibition of DKFZP761E2110 (Accession NM_030953). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761E2110. KIAA0009 (Accession NM_014637) is another VGAM2664 host target gene. KIAA0009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0009 BINDING SITE, designated SEQ ID:16021, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89708] Another function of VGAM2664 is therefore inhibition of KIAA0009 (Accession NM_014637). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0009. KIAA0795 (Accession NM_025010) is another VGAM2664 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0795, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24584, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89709] Another function of VGAM2664 is therefore inhibition of KIAA0795 (Accession NM_025010). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. KIAA1348 (Accession XM_043826) is another VGAM2664 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34032, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89710] Another function of VGAM2664 is therefore inhibition of KIAA1348 (Accession XM_043826). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1348. Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671) is another VGAM2664 host target gene. SLC1A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC1A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A7 BINDING SITE, designated SEQ ID:13491, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89711] Another function of VGAM2664 is therefore inhibition of Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A7. LOC203197 (Accession XM_114645) is another VGAM2664 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43012, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89712] Another function of VGAM2664 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197. LOC221692 (Accession XM_166420) is another VGAM2664 host target gene. LOC221692 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221692 BINDING SITE, designated SEQ ID:44300, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89713] Another function of VGAM2664 is therefore inhibition of LOC221692 (Accession XM_166420). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221692. LOC257464 (Accession XM_116972) is an-

other VGAM2664 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43170, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89714] Another function of VGAM2664 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC92719 (Accession XM_046853) is another VGAM2664 host target gene. LOC92719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92719 BINDING SITE, designated SEQ ID:34846, to the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, also designated SEQ ID:5375.

[89715] Another function of VGAM2664 is therefore inhibition of LOC92719 (Accession XM_046853). Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2665 (VGAM2665) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89716] VGAM2665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2665 was detected is described hereinabove with reference to Figs. 1-8.

[89717] VGAM2665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Parasitica Mitovirus 1-NB631. VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89718] VGAM2665 gene encodes a VGAM2665 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2665 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2665 precursor RNA is designated SEQ ID:2651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2651 is located at position 1362 relative to the genome of Cryphonectria Parasitica Mitovirus 1-NB631.

[89719] VGAM2665 precursor RNA folds onto itself, forming VGAM2665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89720] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2665 folded precursor RNA into VGAM2665 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2665 RNA is designated SEQ ID:5376, and is provided hereinbelow with reference to the sequence listing part.

[89721] VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2665 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89722] VGAM2665 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2665 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89723] The complementary binding of VGAM2665 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2665 host target RNA into VGAM2665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89724] It is appreciated that VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2665 host target genes. The mRNA of each one of this plurality of VGAM2665 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2665 RNA, herein designated VGAM RNA, and which when bound by VGAM2665 RNA causes inhibition of translation of respective one or more VGAM2665 host target proteins.

[89725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2665 gene, herein designated VGAM GENE, on one or more VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89726] It is yet further appreciated that a function of VGAM2665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of viral infection by Cryphonectria Parasitica Mitovirus 1-NB631. Specific functions, and accordingly utilities, of VGAM2665 correlate with, and may be deduced from, the identity of the host target genes which VGAM2665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89727] Nucleotide sequences of the VGAM2665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2665 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2665 are further described hereinbelow with reference to Table 1.

[89728] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2665 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2665 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[89729] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2665 gene, herein designated VGAM is inhibition of expression of VGAM2665 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2665 correlate with, and may be deduced from, the identity of the target genes which VGAM2665 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89730] Agouti Related Protein Homolog (mouse) (AGRP, Accession NM_001138) is a VGAM2665 host target gene. AGRP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AGRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGRP BINDING SITE, designated SEQ ID:6806, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89731] A function of VGAM2665 is therefore inhibition of Agouti Related Protein Homolog (mouse) (AGRP, Accession NM_001138), a gene which plays a role in weight homeostasis. Accordingly, utilities of VGAM2665 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with AGRP. The function of AGRP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM_006614) is another VGAM2665 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13399, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89732] Another function of VGAM2665 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM_006614). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. DKFZp761A132 (Accession NM_032296) is another VGAM2665 host target gene. DKFZp761A132

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761A132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761A132 BINDING SITE, designated SEQ ID:26077, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89733] Another function of VGAM2665 is therefore inhibition of DKFZp761A132 (Accession NM_032296). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761A132. FLJ10375 (Accession NM_018075) is another VGAM2665 host target gene. FLJ10375 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10375 BINDING SITE, designated SEQ ID:19838, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89734] Another function of VGAM2665 is therefore inhibition of FLJ10375 (Accession NM_018075). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10375. FLJ11726 (Accession NM_024971) is another VGAM2665 host target gene. FLJ11726 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726 BINDING SITE, designated SEQ ID:24529, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89735] Another function of VGAM2665 is therefore inhibition of FLJ11726 (Accession NM_024971). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11726. KIAA1956 (Accession XM_085836) is another VGAM2665 host target gene. KIAA1956 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1956, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1956 BINDING SITE, designated SEQ ID:38364, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89736] Another function of VGAM2665 is therefore inhibition of KIAA1956 (Accession XM_085836). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1956. MGC12217 (Accession NM_032771) is another VGAM2665 host target gene. MGC12217 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC12217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12217 BINDING SITE, designated SEQ ID:26517, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89737] Another function of VGAM2665 is therefore inhibition of MGC12217 (Accession NM_032771). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC12217. LOC51622 (Accession NM_015622) is another VGAM2665 host target gene. LOC51622 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51622 BINDING SITE, designated SEQ ID:17885, to the nucleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, also designated SEQ ID:5376.

[89738] Another function of VGAM2665 is therefore inhibition of LOC51622 (Accession NM_015622). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51622. LOC93082 (Accession NM_138397) is another VGAM2665 host target gene. LOC93082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93082 BINDING SITE, designated SEQ ID:28767, to the nucleotide sequence of VGAM2665 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5376.

[89739] Another function of VGAM2665 is therefore inhibition of LOC93082 (Accession NM_138397). Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2666 (VGAM2666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89740] VGAM2666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2666 was detected is described hereinabove with reference to Figs. 1-8.

[89741] VGAM2666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Parasitica Mitovirus 1-NB631. VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89742] VGAM2666 gene encodes a VGAM2666 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2666 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2666 precursor RNA is designated SEQ ID:2652, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2652 is located at position 680 relative to the genome of Cryphonectria Parasitica Mitovirus 1-NB631.

[89743] VGAM2666 precursor RNA folds onto itself, forming VGAM2666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89744] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2666 folded precursor RNA into VGAM2666 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2666 RNA is designated SEQ ID:5377, and is provided hereinbelow with reference to the sequence listing part.

[89745] VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2666 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89746] VGAM2666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2666 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89747] The complementary binding of VGAM2666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2666 host target RNA into VGAM2666 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89748] It is appreciated that VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2666 host target genes. The mRNA of

each one of this plurality of VGAM2666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2666 RNA, herein designated VGAM RNA, and which when bound by VGAM2666 RNA causes inhibition of translation of respective one or more VGAM2666 host target proteins.

[89749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2666 gene, herein designated VGAM GENE, on one or more VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[89750] It is yet further appreciated that a function of VGAM2666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of viral infection by Cryphonectria Parasitica Mitovirus 1-NB631. Specific functions, and accordingly utilities, of VGAM2666 correlate with, and may be deduced from, the identity of the host target genes which VGAM2666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89751] Nucleotide sequences of the VGAM2666 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2666 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2666 are further described hereinbelow with reference to Table 1.

[89752] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2666 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2666 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89753] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2666 gene, herein designated VGAM is inhibition of expression of VGAM2666 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2666 correlate with, and may be deduced from, the identity of the target genes which VGAM2666 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89754] APG5 Autophagy 5-like (S. cerevisiae) (APG5L, Accession NM_004849) is a VGAM2666 host target gene. APG5L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APG5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APG5L BINDING SITE, designated SEQ ID:11262, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89755] A function of VGAM2666 is therefore inhibition of APG5 Autophagy 5-like (S. cerevisiae) (APG5L, Accession NM_004849), a gene which conjugates to apg12 and as-

sociates with isolation membrane to form cup-shaped isolation membrane and autophagosome. Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APG5L. The function of APG5L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492.Complement Component (3b/4b) Receptor 1, Including Knops Blood Group System (CR1, Accession NM_000573) is another VGAM2666 host target gene. CR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CR1 BINDING SITE, designated SEQ ID:6174, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89756] Another function of VGAM2666 is therefore inhibition of Complement Component (3b/4b) Receptor 1, Including Knops Blood Group System (CR1, Accession NM_000573). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with CR1. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is another VGAM2666 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15290, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89757] Another function of VGAM2666 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Peroxiredoxin 3 (PRDX3, Accession XM_055573) is another VGAM2666 host target gene. PRDX3 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDX3 BINDING SITE, designated SEQ ID:36303, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89758] Another function of VGAM2666 is therefore inhibition of Peroxiredoxin 3 (PRDX3, Accession XM_055573), a gene which functions as an antioxidant protein and is required to maintain normal mitochondrial function. Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDX3. The function of PRDX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Recombination Activating Gene 1 (RAG1, Accession NM_000448) is another VGAM2666 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:6036, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89759] Another function of VGAM2666 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695) is another VGAM2666 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35482, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89760] Another function of VGAM2666 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695), a gene which may take part in defining the

lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.CAP350 (Accession NM_014810) is another VGAM2666 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAP350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:16769, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89761] Another function of VGAM2666 is therefore inhibition of CAP350 (Accession NM_014810). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. DKFZP434I092 (Accession XM_042042) is another VGAM2666 host target gene. DKFZP434I092 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33671, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89762] Another function of VGAM2666 is therefore inhibition of DKFZP434I092 (Accession XM_042042). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. FLJ10874 (Accession NM_018252) is another VGAM2666 host target gene. FLJ10874 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10874, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10874 BINDING SITE, designated SEQ ID:20219, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89763] Another function of VGAM2666 is therefore inhibition of FLJ10874 (Accession NM_018252). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10874. FLJ11383 (Accession NM_024938) is another VGAM2666 host target gene. FLJ11383 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11383 BINDING SITE, designated SEQ ID:24477, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89764] Another function of VGAM2666 is therefore inhibition of FLJ11383 (Accession NM_024938). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11383. KIAA0459 (Accession XM_027862) is another VGAM2666 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30576, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89765] Another function of VGAM2666 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0599 (Accession XM_085127) is another VGAM2666 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37851, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89766] Another function of VGAM2666 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0599. KIAA0669 (Accession NM_014779) is another VGAM2666 host target gene. KIAA0669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0669 BINDING SITE, designated SEQ ID:16627, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89767] Another function of VGAM2666 is therefore inhibition of KIAA0669 (Accession NM_014779). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0669. KIAA1317 (Accession XM_098368) is another VGAM2666 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41621, to the nucleotide sequence of VGAM2666 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5377.

[89768] Another function of VGAM2666 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. LOC158722 (Accession XM_088653) is another VGAM2666 host target gene. LOC158722 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158722 BINDING SITE, designated SEQ ID:39888, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89769] Another function of VGAM2666 is therefore inhibition of LOC158722 (Accession XM_088653). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158722. LOC169026 (Accession XM_095471) is another VGAM2666 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169026, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40263, to the nucleotide sequence of VGAM2666 RNA, herein designated VGAM RNA, also designated SEQ ID:5377.

[89770] Another function of VGAM2666 is therefore inhibition of LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2667 (VGAM2667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89771] VGAM2667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2667 was detected is described hereinabove with reference to Figs. 1-8.

[89772] VGAM2667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic

Necrosis Virus. VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89773] VGAM2667 gene encodes a VGAM2667 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2667 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2667 precursor RNA is designated SEQ ID:2653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2653 is located at position 9077 relative to the genome of Bean Common Mosaic Necrosis Virus.

[89774] VGAM2667 precursor RNA folds onto itself, forming VGAM2667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89775] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2667 folded precursor RNA into VGAM2667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2667 RNA is designated SEQ ID:5378, and is provided hereinbelow with reference to the sequence listing part.

[89776] VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2667 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89777] VGAM2667 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2667 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89778] The complementary binding of VGAM2667 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2667 host target RNA into VGAM2667 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89779] It is appreciated that VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2667 host target genes. The mRNA of each one of this plurality of VGAM2667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2667 RNA, herein designated VGAM RNA, and which when bound by VGAM2667 RNA causes inhibition of translation of respective one or more VGAM2667 host target proteins.

[89780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2667 gene, herein designated VGAM GENE, on one or more VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89781] It is yet further appreciated that a function of VGAM2667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2667 correlate with, and may be deduced from, the identity of the host target genes which VGAM2667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89782] Nucleotide sequences of the VGAM2667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2667 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2667 are further described hereinbelow with reference to Table 1.

[89783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2667 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89784] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2667 gene, herein designated VGAM is inhibition of expression of VGAM2667 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2667 correlate with, and may be deduced from, the identity of the target genes which VGAM2667 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89785] CASP8 Associated Protein 2 (CASP8AP2, Accession NM_012115) is a VGAM2667 host target gene. CASP8AP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASP8AP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8AP2 BINDING SITE, designated SEQ

ID:14430, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89786] A function of VGAM2667 is therefore inhibition of CASP8 Associated Protein 2 (CASP8AP2, Accession NM_012115), a gene which interacts with and activates caspase-8 in Fas-mediated apoptosis. Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8AP2. The function of CASP8AP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM581.Leukemia Inhibitory Factor Receptor (LIFR, Accession NM_002310) is another VGAM2667 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:8105, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89787] Another function of VGAM2667 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM_002310). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. NDRG Family Member 3 (NDRG3, Accession NM_032013) is another VGAM2667 host target gene. NDRG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDRG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE, designated SEQ ID:25721, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89788] Another function of VGAM2667 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM_032013). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. Polycystic Kidney Disease 2 (autosomal dominant) (PKD2, Accession XM_011124) is another VGAM2667 host target gene. PKD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PKD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD2 BINDING SITE, designated SEQ ID:30176, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89789] Another function of VGAM2667 is therefore inhibition of Polycystic Kidney Disease 2 (autosomal dominant) (PKD2, Accession XM_011124). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2. C16orf5 (Accession NM_013399) is another VGAM2667 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15055, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89790] Another function of VGAM2667 is therefore inhibition of

C16orf5 (Accession NM_013399). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. FLJ22635 (Accession NM_025092) is another VGAM2667 host target gene. FLJ22635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22635 BINDING SITE, designated SEQ ID:24718, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89791] Another function of VGAM2667 is therefore inhibition of FLJ22635 (Accession NM_025092). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22635. KIAA0391 (Accession NM_014672) is another VGAM2667 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16135, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89792] Another function of VGAM2667 is therefore inhibition of KIAA0391 (Accession NM_014672). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. KIAA1340 (Accession XM_044836) is another VGAM2667 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:34297, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89793] Another function of VGAM2667 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. KIAA1576 (Accession XM_038186) is another

VGAM2667 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32777, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89794] Another function of VGAM2667 is therefore inhibition of KIAA1576 (Accession XM_038186). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. MGC13033 (Accession NM_031447) is another VGAM2667 host target gene. MGC13033 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13033 BINDING SITE, designated SEQ ID:25461, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89795] Another function of VGAM2667 is therefore inhibition of MGC13033 (Accession NM_031447). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13033. Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM_007229) is another VGAM2667 host target gene. PACSIN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PACSIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN2 BINDING SITE, designated SEQ ID:14099, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89796] Another function of VGAM2667 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM_007229). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN2. PRO2015 (Accession NM_018512) is another VGAM2667 host target gene. PRO2015 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by PRO2015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2015 BINDING SITE, designated SEQ ID:20583, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89797] Another function of VGAM2667 is therefore inhibition of PRO2015 (Accession NM_018512). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2015. Rpo1-2 (Accession NM_019014) is another VGAM2667 host target gene. Rpo1-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Rpo1-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE, designated SEQ ID:21107, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89798] Another function of VGAM2667 is therefore inhibition of Rpo1-2 (Accession NM_019014). Accordingly, utilities of

VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. STI2 (Accession XM_114335) is another VGAM2667 host target gene. STI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STI2 BINDING SITE, designated SEQ ID:42878, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89799] Another function of VGAM2667 is therefore inhibition of STI2 (Accession XM_114335). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STI2. LOC140214 (Accession XM_071283) is another VGAM2667 host target gene. LOC140214 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC140214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC140214 BINDING SITE, designated SEQ ID:37399, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89800] Another function of VGAM2667 is therefore inhibition of LOC140214 (Accession XM_071283). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC140214. LOC142927 (Accession XM_084380) is another VGAM2667 host target gene. LOC142927 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:37566, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89801] Another function of VGAM2667 is therefore inhibition of LOC142927 (Accession XM_084380). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142927. LOC150311 (Accession XM_086858) is another VGAM2667 host target gene. LOC150311 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150311 BINDING SITE, designated SEQ ID:38928, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89802] Another function of VGAM2667 is therefore inhibition of LOC150311 (Accession XM_086858). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150311. LOC158267 (Accession XM_088528) is another VGAM2667 host target gene. LOC158267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158267 BINDING SITE, designated SEQ ID:39791, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89803] Another function of VGAM2667 is therefore inhibition of

LOC158267 (Accession XM_088528). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158267. LOC219445 (Accession XM_166212) is another VGAM2667 host target gene. LOC219445 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219445 BINDING SITE, designated SEQ ID:44010, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89804] Another function of VGAM2667 is therefore inhibition of LOC219445 (Accession XM_166212). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219445. LOC220514 (Accession XM_017498) is another VGAM2667 host target gene. LOC220514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC220514 BINDING SITE, designated SEQ ID:30323, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89805] Another function of VGAM2667 is therefore inhibition of LOC220514 (Accession XM_017498). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220514. LOC90841 (Accession XM_034427) is another VGAM2667 host target gene. LOC90841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:32110, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89806] Another function of VGAM2667 is therefore inhibition of LOC90841 (Accession XM_034427). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841. LOC93259 (Accession XM_050105) is another

VGAM2667 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35555, to the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, also designated SEQ ID:5378.

[89807] Another function of VGAM2667 is therefore inhibition of LOC93259 (Accession XM_050105). Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2668 (VGAM2668) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89808] VGAM2668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2668 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[89809] VGAM2668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89810] VGAM2668 gene encodes a VGAM2668 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2668 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2668 precursor RNA is designated SEQ ID:2654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2654 is located at position 5617 relative to the genome of Bean Common Mosaic Necrosis Virus.

[89811] VGAM2668 precursor RNA folds onto itself, forming VGAM2668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89812] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2668 folded precursor RNA into VGAM2668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM2668 RNA is designated SEQ ID:5379, and is provided hereinbelow with reference to the sequence listing part.

[89813] VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2668 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89814] VGAM2668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2668 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89815] The complementary binding of VGAM2668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2668 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2668 host target RNA into VGAM2668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89816] It is appreciated that VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2668 host target genes. The mRNA of each one of this plurality of VGAM2668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2668 RNA, herein designated VGAM RNA, and which when bound by VGAM2668 RNA causes inhibition of translation of respective one or more VGAM2668 host target proteins.

[89817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2668 gene, herein designated VGAM GENE, on one or more VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89818] It is yet further appreciated that a function of VGAM2668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2668 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2668 correlate with, and may be deduced from, the identity of the host target genes which VGAM2668 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89819] Nucleotide sequences of the VGAM2668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2668 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2668 are further described hereinbelow with reference to Table 1.

[89820] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2668 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89821] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2668 gene, herein designated VGAM is inhibition of expression of VGAM2668 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2668 correlate with, and may be deduced from, the identity of the target genes which VGAM2668 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89822] ZF (Accession NM_021212) is a VGAM2668 host target gene. ZF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of ZF BINDING SITE, designated SEQ ID:22192, to the nucleotide sequence of VGAM2668 RNA, herein designated VGAM RNA, also designated SEQ ID:5379.

[89823] A function of VGAM2668 is therefore inhibition of ZF (Accession NM_021212). Accordingly, utilities of VGAM2668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF. LOC114984 (Accession XM_054962) is another VGAM2668 host target gene. LOC114984 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC114984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114984 BINDING SITE, designated SEQ ID:36219, to the nucleotide sequence of VGAM2668 RNA, herein designated VGAM RNA, also designated SEQ ID:5379.

[89824] Another function of VGAM2668 is therefore inhibition of LOC114984 (Accession XM_054962). Accordingly, utilities of VGAM2668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114984. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2669 (VGAM2669) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89825] VGAM2669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2669 was detected is described hereinabove with reference to Figs. 1-8.

[89826] VGAM2669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM2669 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89827] VGAM2669 gene encodes a VGAM2669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2669 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2669 precursor RNA is designated SEQ ID:2655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2655 is located at position 1919 relative to the genome of Bean Common Mosaic Necrosis Virus.

[89828] VGAM2669 precursor RNA folds onto itself, forming VGAM2669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89829] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2669 folded precursor RNA into VGAM2669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2669 RNA is designated SEQ ID:5380, and is provided hereinbelow with reference to the sequence listing part.

[89830] VGAM2669 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2669 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89831] VGAM2669 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2669 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2669 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89832] The complementary binding of VGAM2669 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2669 host target RNA into VGAM2669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89833] It is appreciated that VGAM2669 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2669 host target genes. The mRNA of each one of this plurality of VGAM2669 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2669 RNA, herein designated VGAM RNA, and which when bound by VGAM2669 RNA causes inhibition of translation of respective one or more

VGAM2669 host target proteins.

[89834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2669 gene, herein designated VGAM GENE, on one or more VGAM2669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89835] It is yet further appreciated that a function of VGAM2669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic

Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2669 correlate with, and may be deduced from, the identity of the host target genes which VGAM2669 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89836] Nucleotide sequences of the VGAM2669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2669 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2669 are further described hereinbelow with reference to Table 1.

[89837] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2669 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2669 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89838] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2669 gene, herein designated VGAM is inhibition of expression of VGAM2669 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2669 correlate with, and may be deduced from, the identity of the target genes which VGAM2669 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89839] BRCA1 Associated Protein-1 (ubiquitin carboxy-terminal hydrolase) (BAP1, Accession NM_004656) is a VGAM2669 host target gene. BAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAP1 BINDING SITE, designated SEQ ID:11022, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89840] A function of VGAM2669 is therefore inhibition of BRCA1 Associated Protein-1 (ubiquitin carboxy-terminal hydrolase) (BAP1, Accession NM_004656). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAP1. D12S2489E (Accession NM_007360) is another VGAM2669 host target gene. D12S2489E BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by D12S2489E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D12S2489E BINDING SITE, designated SEQ ID:14290, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89841] Another function of VGAM2669 is therefore inhibition of D12S2489E (Accession NM_007360), a gene which interacts in the inhibition and activation of NK cells. Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D12S2489E. The function of D12S2489E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM156.Dystrobrevin, Alpha (DTNA, Accession NM_032978) is another VGAM2669 host target gene. DTNA BINDING SITE1 through DTNA BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DTNA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

DTNA BINDING SITE1 through DTNA BINDING SITE4, designated SEQ ID:26837, SEQ ID:26842, SEQ ID:26847 and SEQ ID:7079 respectively, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89842] Another function of VGAM2669 is therefore inhibition of Dystrobrevin, Alpha (DTNA, Accession NM_032978), a gene which may be involved in the formation and stability of synapses. Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNA. The function of DTNA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1021.Forkhead Box F1 (FOXF1, Accession NM_001451) is another VGAM2669 host target gene. FOXF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXF1 BINDING SITE, designated SEQ ID:7185, to the nucleotide sequence of VGAM2669 RNA, herein

designated VGAM RNA, also designated SEQ ID:5380.

[89843] Another function of VGAM2669 is therefore inhibition of Forkhead Box F1 (FOXF1, Accession NM_001451), a gene which is a probable transcription activator for a number of lung- specific genes. Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXF1. The function of FOXF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM_000195) is another VGAM2669 host target gene. HPS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPS1 BINDING SITE, designated SEQ ID:5692, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89844] Another function of VGAM2669 is therefore inhibition of Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM_000195). Accordingly, utilities of VGAM2669 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS1. Protein Kinase, CGMP-dependent, Type II (PRKG2, Accession NM_006259) is another VGAM2669 host target gene. PRKG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG2 BINDING SITE, designated SEQ ID:12939, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89845] Another function of VGAM2669 is therefore inhibition of Protein Kinase, CGMP-dependent, Type II (PRKG2, Accession NM_006259), a gene which regulate a great variety of functions, including smooth muscle relaxation, neuronal excitability, and epithelial electrolyte transport. Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG2. The function of PRKG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM16.Zinc Finger Protein 216

(ZNF216, Accession NM_006007) is another VGAM2669 host target gene. ZNF216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF216 BINDING SITE, designated SEQ ID:12620, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89846] Another function of VGAM2669 is therefore inhibition of Zinc Finger Protein 216 (ZNF216, Accession NM_006007). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF216. ATP-binding Cassette, Subfamily A (ABC1), Member 10 (ABCA10, Accession NM_080282) is another VGAM2669 host target gene. ABCA10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABCA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA10 BINDING SITE, designated SEQ

ID:27823, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89847] Another function of VGAM2669 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM_080282). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA10. FLJ12425 (Accession XM_098290) is another VGAM2669 host target gene. FLJ12425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12425 BINDING SITE, designated SEQ ID:41561, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89848] Another function of VGAM2669 is therefore inhibition of FLJ12425 (Accession XM_098290). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12425. FLJ12484 (Accession NM_022767) is another

VGAM2669 host target gene. FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2, designated SEQ ID:23015 and SEQ ID:34513 respectively, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89849] Another function of VGAM2669 is therefore inhibition of FLJ12484 (Accession NM_022767). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. FLJ22195 (Accession NM_022758) is another VGAM2669 host target gene. FLJ22195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22195 BINDING SITE, designated SEQ ID:22996, to the nucleotide

sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89850] Another function of VGAM2669 is therefore inhibition of FLJ22195 (Accession NM_022758). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22195. KIAA0472 (Accession XM_050147) is another VGAM2669 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35573, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89851] Another function of VGAM2669 is therefore inhibition of KIAA0472 (Accession XM_050147). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA0794 (Accession XM_087353) is another VGAM2669 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39176, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89852] Another function of VGAM2669 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM2669 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:21387, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89853] Another function of VGAM2669 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession

NM_020168). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. Retinoic Acid Induced 17 (RAI17, Accession XM_166091) is another VGAM2669 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43856, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89854] Another function of VGAM2669 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM_166091). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. RHO6 (Accession NM_014470) is another VGAM2669 host target gene. RHO6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHO6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of RHO6 BINDING SITE, designated SEQ ID:15819, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89855] Another function of VGAM2669 is therefore inhibition of RHO6 (Accession NM_014470). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHO6. LOC155006 (Accession XM_088117) is another VGAM2669 host target gene. LOC155006 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:39522, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89856] Another function of VGAM2669 is therefore inhibition of LOC155006 (Accession XM_088117). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006. LOC199926 (Accession XM_117157) is an-

other VGAM2669 host target gene. LOC199926 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199926 BINDING SITE, designated SEQ ID:43258, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89857] Another function of VGAM2669 is therefore inhibition of LOC199926 (Accession XM_117157). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199926. LOC202316 (Accession XM_117380) is another VGAM2669 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43422, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89858] Another function of VGAM2669 is therefore inhibition of LOC202316 (Accession XM_117380). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. LOC219899 (Accession XM_166173) is another VGAM2669 host target gene. LOC219899 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219899 BINDING SITE, designated SEQ ID:43992, to the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, also designated SEQ ID:5380.

[89859] Another function of VGAM2669 is therefore inhibition of LOC219899 (Accession XM_166173). Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219899. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2670 (VGAM2670) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[89860] VGAM2670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2670 was detected is described hereinabove with reference to Figs. 1-8.

[89861] VGAM2670 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89862] VGAM2670 gene encodes a VGAM2670 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2670 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2670 precursor RNA is designated SEQ ID:2656, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2656 is located at position 5302 relative to the genome of Bean Common Mosaic Necrosis Virus.

[89863] VGAM2670 precursor RNA folds onto itself, forming VGAM2670 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89864] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2670 folded precursor RNA into VGAM2670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2670 RNA is designated SEQ ID:5381, and is provided hereinbelow with reference to the sequence listing part.

[89865] VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2670 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89866] VGAM2670 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2670 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89867] The complementary binding of VGAM2670 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2670 host target RNA into VGAM2670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89868] It is appreciated that VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2670 host target genes. The mRNA of each one of this plurality of VGAM2670 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2670 RNA, herein designated VGAM RNA, and which when bound by VGAM2670 RNA causes inhibition of translation of respective one or more VGAM2670 host target proteins.

[89869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2670 gene, herein designated VGAM GENE, on one or more VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89870] It is yet further appreciated that a function of VGAM2670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2670 correlate with, and may be deduced from, the identity of the host target genes which VGAM2670 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[89871] Nucleotide sequences of the VGAM2670 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2670 are further described hereinbelow with reference to Table 1.

[89872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2670 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89873] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2670 gene, herein designated VGAM is inhibition of expression of VGAM2670 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2670 correlate with, and may be deduced from, the identity of the target genes which VGAM2670 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89874] ATP Synthase, H+ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710) is a VGAM2670 host target gene. ATP5B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP5B BINDING SITE, designated SEQ ID:30005, to the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, also designated SEQ ID:5381.

[89875] A function of VGAM2670 is therefore inhibition of ATP Synthase, H+ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710). Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP5B. ISL1 Transcription Factor, LIM/homeodomain, (islet-1) (ISL1, Accession NM_002202) is another VGAM2670 host target gene. ISL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ISL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ISL1 BINDING SITE, designated SEQ ID:7959, to the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, also designated SEQ ID:5381.

[89876] Another function of VGAM2670 is therefore inhibition of ISL1 Transcription Factor, LIM/homeodomain, (islet-1) (ISL1, Accession NM_002202), a gene which binds to one of the cis-acting domain of the insulin gene enhancer. Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL1. The function of ISL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464.TRIM (Accession NM_016388) is another VGAM2670 host target gene. TRIM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM BINDING SITE, designated SEQ ID:18529, to the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, also designated SEQ ID:5381.

[89877] Another function of VGAM2670 is therefore inhibition of TRIM (Accession NM_016388), a gene which plays a role in recruiting signaling proteins to the plasma membrane upon T-cell receptor (TCR) complex activation in T cells. Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM. The function of TRIM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM227.Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958) is another VGAM2670 host target gene. ARHGEF15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF15 BINDING SITE, designated SEQ ID:17317, to the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, also designated SEQ ID:5381.

[89878] Another function of VGAM2670 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 15

(ARHGEF15, Accession NM_014958). Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF15. KIAA0326 (Accession XM_034819) is another VGAM2670 host target gene. KIAA0326 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0326 BINDING SITE, designated SEQ ID:32158, to the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, also designated SEQ ID:5381.

[89879] Another function of VGAM2670 is therefore inhibition of KIAA0326 (Accession XM_034819). Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0326. KIAA0416 (Accession NM_015564) is another VGAM2670 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17833, to the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, also designated SEQ ID:5381.

[89880] Another function of VGAM2670 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2671 (VGAM2671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89881] VGAM2671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2671 was detected is described hereinabove with reference to Figs. 1-8.

[89882] VGAM2671 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[89883] VGAM2671 gene encodes a VGAM2671 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2671 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2671 precursor RNA is designated SEQ ID:2657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2657 is located at position 673 relative to the genome of Ophiostoma Mitovirus 3a.

[89884] VGAM2671 precursor RNA folds onto itself, forming VGAM2671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89885] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2671 folded precursor RNA into VGAM2671 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2671 RNA is designated SEQ ID:5382, and is provided hereinbelow with reference to the sequence listing part.

[89886] VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2671 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89887] VGAM2671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2671 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89888] The complementary binding of VGAM2671 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2671 host target RNA into VGAM2671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89889] It is appreciated that VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2671 host target genes. The mRNA of each one of this plurality of VGAM2671 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2671 RNA, herein designated VGAM RNA, and which when bound by VGAM2671 RNA causes inhibition of translation of respective one or more VGAM2671 host target proteins.

[89890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2671 gene, herein designated VGAM GENE, on one or more VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89891] It is yet further appreciated that a function of VGAM2671 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2671 include diagnosis, prevention and treatment of viral infection by Ophiostoma Mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2671 correlate with, and may be deduced from, the identity of the host target genes which VGAM2671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89892] Nucleotide sequences of the VGAM2671 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2671 are further described hereinbelow with reference to Table 1.

[89893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2671 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2671 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89894] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2671 gene, herein designated VGAM is inhibition of expression of VGAM2671 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2671 correlate with, and may be deduced from, the identity of the target genes which VGAM2671 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89895] MGC15705 (Accession NM_032757) is a VGAM2671 host target gene. MGC15705 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15705 BINDING SITE, designated SEQ ID:26499, to the nucleotide sequence of VGAM2671 RNA, herein designated VGAM RNA, also designated SEQ ID:5382.

[89896] A function of VGAM2671 is therefore inhibition of MGC15705 (Accession NM_032757). Accordingly, utilities of VGAM2671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15705. LOC153561 (Accession XM_087708) is another VGAM2671 host target gene. LOC153561 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153561 BINDING SITE, designated SEQ ID:39401, to the nucleotide sequence of VGAM2671 RNA, herein designated VGAM RNA, also designated SEQ ID:5382.

[89897] Another function of VGAM2671 is therefore inhibition of LOC153561 (Accession XM_087708). Accordingly, utilities of VGAM2671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153561. LOC223073 (Accession XM_170293) is another VGAM2671 host target gene. LOC223073 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC223073, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC223073 BINDING SITE, designated SEQ ID:45315, to the nucleotide sequence of VGAM2671 RNA, herein designated VGAM RNA, also designated SEQ ID:5382.

[89898] Another function of VGAM2671 is therefore inhibition of LOC223073 (Accession XM_170293). Accordingly, utilities of VGAM2671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC223073. LOC255231 (Accession XM_170908) is another VGAM2671 host target gene. LOC255231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255231 BINDING SITE, designated SEQ ID:45672, to the nucleotide sequence of VGAM2671 RNA, herein designated VGAM RNA, also designated SEQ ID:5382.

[89899] Another function of VGAM2671 is therefore inhibition of LOC255231 (Accession XM_170908). Accordingly, utilities of VGAM2671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2672 (VGAM2672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89900] VGAM2672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2672 was detected is described hereinabove with reference to Figs. 1-8.

[89901] VGAM2672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89902] VGAM2672 gene encodes a VGAM2672 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2672 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2672 precursor RNA is designated SEQ ID:2658, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2658 is located at position 1136 relative to the genome of Ophiostoma Mitovirus 3a.

[89903] VGAM2672 precursor RNA folds onto itself, forming VGAM2672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89904] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2672 folded precursor RNA into VGAM2672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2672 RNA is designated SEQ ID:5383, and is provided hereinbelow with reference to the sequence listing part.

[89905] VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2672 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89906] VGAM2672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2672 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2672 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89907] The complementary binding of VGAM2672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2672 host target RNA into VGAM2672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89908] It is appreciated that VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2672 host target genes. The mRNA of each one of this plurality of VGAM2672 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2672 RNA, herein designated VGAM RNA, and which when bound by VGAM2672 RNA causes

inhibition of translation of respective one or more VGAM2672 host target proteins.

[89909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2672 gene, herein designated VGAM GENE, on one or more VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89910] It is yet further appreciated that a function of VGAM2672 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2672 include diagnosis, prevention and

treatment of viral infection by Ophiostoma Mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2672 correlate with, and may be deduced from, the identity of the host target genes which VGAM2672 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89911] Nucleotide sequences of the VGAM2672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2672 are further described hereinbelow with reference to Table 1.

[89912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2672 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89913] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2672 gene, herein designated VGAM is inhibition of expression of VGAM2672 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2672 correlate with, and may be deduced from, the identity of the target genes which VGAM2672 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89914] DXYS155E (Accession NM_005088) is a VGAM2672 host target gene. DXYS155E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DXYS155E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXYS155E BINDING SITE, designated SEQ ID:11542, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89915] A function of VGAM2672 is therefore inhibition of DXYS155E (Accession NM_005088), a gene which may be involved in b-cell activation. may also be involved in signal transduction and gene regulation. Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXYS155E. The function of DXYS155E and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM766.Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935) is another VGAM2672 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12572, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89916] Another function of VGAM2672 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM57.DKFZP761E2110 (Accession NM_030953) is another VGAM2672 host target gene. DKFZP761E2110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761E2110 BINDING SITE, designated SEQ ID:25227, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89917] Another function of VGAM2672 is therefore inhibition of DKFZP761E2110 (Accession NM_030953). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761E2110. Phosphoinositide-3-kinase, Regulatory Subunit 4, P150 (PIK3R4, Accession XM_030812) is another VGAM2672 host target gene. PIK3R4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PIK3R4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PIK3R4 BINDING SITE, designated SEQ ID:31149, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89918] Another function of VGAM2672 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit 4, P150 (PIK3R4, Accession XM_030812). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R4. Transmembrane Protease, Serine 5 (spinesin) (TMPRSS5, Accession NM_030770) is another VGAM2672 host target gene. TMPRSS5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMPRSS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMPRSS5 BINDING SITE, designated SEQ ID:25055, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89919] Another function of VGAM2672 is therefore inhibition of Transmembrane Protease, Serine 5 (spinesin) (TMPRSS5, Accession NM_030770). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TMPRSS5. LOC129011 (Accession XM_059326) is another VGAM2672 host target gene. LOC129011 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC129011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129011 BINDING SITE, designated SEQ ID:36966, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89920] Another function of VGAM2672 is therefore inhibition of LOC129011 (Accession XM_059326). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129011. LOC132235 (Accession XM_072302) is another VGAM2672 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37481, to

the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89921] Another function of VGAM2672 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC144363 (Accession XM_084843) is another VGAM2672 host target gene. LOC144363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144363 BINDING SITE, designated SEQ ID:37731, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89922] Another function of VGAM2672 is therefore inhibition of LOC144363 (Accession XM_084843). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144363. LOC144571 (Accession XM_096630) is another VGAM2672 host target gene. LOC144571 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC144571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144571 BINDING SITE, designated SEQ ID:40443, to the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, also designated SEQ ID:5383.

[89923] Another function of VGAM2672 is therefore inhibition of LOC144571 (Accession XM_096630). Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144571. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2673 (VGAM2673) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89924] VGAM2673 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2673 was detected is described hereinabove with reference to Figs. 1-8.

[89925] VGAM2673 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89926] VGAM2673 gene encodes a VGAM2673 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2673 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2673 precursor RNA is designated SEQ ID:2659, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2659 is located at position 308 relative to the genome of Ophiostoma Mitovirus 3a.

[89927] VGAM2673 precursor RNA folds onto itself, forming VGAM2673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89928] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2673 folded precursor RNA into VGAM2673 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2673 RNA is designated SEQ ID:5384, and is provided hereinbelow with reference to the sequence listing part.

[89929] VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2673 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89930] VGAM2673 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2673 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2673 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89931] The complementary binding of VGAM2673 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2673

host target RNA into VGAM2673 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89932] It is appreciated that VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2673 host target genes. The mRNA of each one of this plurality of VGAM2673 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2673 RNA, herein designated VGAM RNA, and which when bound by VGAM2673 RNA causes inhibition of translation of respective one or more VGAM2673 host target proteins.

[89933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2673 gene, herein designated VGAM GENE, on one or more VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89934] It is yet further appreciated that a function of VGAM2673 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2673 include diagnosis, prevention and treatment of viral infection by Ophiostoma Mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2673 correlate with, and may be deduced from, the identity of the host target genes which VGAM2673 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89935] Nucleotide sequences of the VGAM2673 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2673 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2673 are further

described hereinbelow with reference to Table 1.

[89936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2673 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2673 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89937] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2673 gene, herein designated VGAM is inhibition of expression of VGAM2673 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2673 correlate with, and may be deduced from, the identity of the target genes which VGAM2673 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89938] Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is a VGAM2673 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9669, to the nucleotide sequence of VGAM2673 RNA, herein designated VGAM RNA, also designated SEQ ID:5384.

[89939] A function of VGAM2673 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM2673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM66.LEC3 (Accession NM_015236) is another VGAM2673 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17570, to the nucleotide sequence of VGAM2673 RNA, herein designated VGAM

RNA, also designated SEQ ID:5384.

[89940] Another function of VGAM2673 is therefore inhibition of LEC3 (Accession NM_015236). Accordingly, utilities of VGAM2673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. MGC2835 (Accession NM_024072) is another VGAM2673 host target gene. MGC2835 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2835 BINDING SITE, designated SEQ ID:23502, to the nucleotide sequence of VGAM2673 RNA, herein designated VGAM RNA, also designated SEQ ID:5384.

[89941] Another function of VGAM2673 is therefore inhibition of MGC2835 (Accession NM_024072). Accordingly, utilities of VGAM2673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2835. LOC196264 (Accession XM_113683) is another VGAM2673 host target gene. LOC196264 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196264, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42332, to the nucleotide sequence of VGAM2673 RNA, herein designated VGAM RNA, also designated SEQ ID:5384.

[89942] Another function of VGAM2673 is therefore inhibition of LOC196264 (Accession XM_113683). Accordingly, utilities of VGAM2673 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC202460 (Accession XM_114493) is another VGAM2673 host target gene. LOC202460 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202460 BINDING SITE, designated SEQ ID:42980, to the nucleotide sequence of VGAM2673 RNA, herein designated VGAM RNA, also designated SEQ ID:5384.

[89943] Another function of VGAM2673 is therefore inhibition of LOC202460 (Accession XM_114493). Accordingly, utilities of VGAM2673 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC202460. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2674 (VGAM2674) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89944] VGAM2674 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2674 was detected is described hereinabove with reference to Figs. 1-8.

[89945] VGAM2674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89946] VGAM2674 gene encodes a VGAM2674 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2674 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2674 precursor RNA is desig-

nated SEQ ID:2660, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2660 is located at position 2100 relative to the genome of Ophiostoma Mitovirus 3a.

[89947] VGAM2674 precursor RNA folds onto itself, forming VGAM2674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89948] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2674 folded precursor RNA into VGAM2674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2674 RNA is designated SEQ ID:5385, and is provided hereinbelow with reference to the sequence

listing part.

[89949] VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2674 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89950] VGAM2674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2674 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2674 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89951] The complementary binding of VGAM2674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2674 host target RNA into VGAM2674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89952] It is appreciated that VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2674 host target genes. The mRNA of each one of this plurality of VGAM2674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2674 RNA, herein designated VGAM

RNA, and which when bound by VGAM2674 RNA causes inhibition of translation of respective one or more VGAM2674 host target proteins.

[89953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2674 gene, herein designated VGAM GENE, on one or more VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89954] It is yet further appreciated that a function of VGAM2674 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2674 include diagnosis, prevention and treatment of viral infection by Ophiostoma Mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2674 correlate with, and may be deduced from, the identity of the host target genes which VGAM2674 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[89955] Nucleotide sequences of the VGAM2674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2674 are further described hereinbelow with reference to Table 1.

[89956] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2674 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[89957] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2674 gene, herein designated VGAM is

inhibition of expression of VGAM2674 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2674 correlate with, and may be deduced from, the identity of the target genes which VGAM2674 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[89958] B-cell CLL/lymphoma 10 (BCL10, Accession NM_003921) is a VGAM2674 host target gene. BCL10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL10 BINDING SITE, designated SEQ ID:10008, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89959] A function of VGAM2674 is therefore inhibition of B-cell CLL/lymphoma 10 (BCL10, Accession NM_003921), a gene which is a positive regulator of lymphocyte proliferation, NF-kappaB activator. Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL10. The function of BCL10 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Claudin 14 (CLDN14, Accession NM_144492) is another VGAM2674 host target gene. CLDN14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CLDN14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN14 BINDING SITE, designated SEQ ID:29310, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89960] Another function of VGAM2674 is therefore inhibition of Claudin 14 (CLDN14, Accession NM_144492), a gene which provides structural support for the auditory neuroepithelium. Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN14. The function of CLDN14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1316.Glucosamine-6-phosphate Isomerase (GNPI, Accession NM_005471) is another VGAM2674 host target

gene. GNPI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNPI BINDING SITE, designated SEQ ID:11967, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89961] Another function of VGAM2674 is therefore inhibition of Glucosamine-6-phosphate Isomerase (GNPI, Accession NM_005471), a gene which converts glucosamine-6-phosphate to fructose-6-phosphate. Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNPI. The function of GNPI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM124.Ornithine Carbamoyltransferase (OTC, Accession NM_000531) is another VGAM2674 host target gene. OTC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OTC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of OTC BINDING SITE, designated SEQ ID:6133, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89962] Another function of VGAM2674 is therefore inhibition of Ornithine Carbamoyltransferase (OTC, Accession NM_000531). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTC. Arginine-glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM_012102) is another VGAM2674 host target gene. RERE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14406, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89963] Another function of VGAM2674 is therefore inhibition of Arginine-glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM2674

include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.Asporin (LRR class 1) (ASPN, Accession NM_017680) is another VGAM2674 host target gene. ASPN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ASPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPN BINDING SITE, designated SEQ ID:19224, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89964] Another function of VGAM2674 is therefore inhibition of Asporin (LRR class 1) (ASPN, Accession NM_017680). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPN. Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM_030809) is another VGAM2674 host target gene. C12orf22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by C12orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf22 BINDING SITE, designated SEQ ID:25127, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89965] Another function of VGAM2674 is therefore inhibition of Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM_030809). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf22. Caspase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM_001229) is another VGAM2674 host target gene. CASP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP9 BINDING SITE, designated SEQ ID:6900, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89966] Another function of VGAM2674 is therefore inhibition of

Caspase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM_001229). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP9. DKFZP434J193 (Accession XM_048452) is another VGAM2674 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J193 BINDING SITE, designated SEQ ID:35165, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89967] Another function of VGAM2674 is therefore inhibition of DKFZP434J193 (Accession XM_048452). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. DKFZP564B1162 (Accession NM_031305) is another VGAM2674 host target gene. DKFZP564B1162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564B1162, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B1162 BINDING SITE, designated SEQ ID:25338, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89968] Another function of VGAM2674 is therefore inhibition of DKFZP564B1162 (Accession NM_031305). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B1162. FLJ10997 (Accession NM_018293) is another VGAM2674 host target gene. FLJ10997 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10997 BINDING SITE, designated SEQ ID:20283, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89969] Another function of VGAM2674 is therefore inhibition of FLJ10997 (Accession NM_018293). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10997. FLJ12903 (Accession NM_022753) is another VGAM2674 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22979, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89970] Another function of VGAM2674 is therefore inhibition of FLJ12903 (Accession NM_022753). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. FLJ13189 (Accession NM_024882) is another VGAM2674 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24331, to the nucleotide

sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89971] Another function of VGAM2674 is therefore inhibition of FLJ13189 (Accession NM_024882). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13189. FLJ13615 (Accession NM_025114) is another VGAM2674 host target gene. FLJ13615 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13615 BINDING SITE, designated SEQ ID:24764, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89972] Another function of VGAM2674 is therefore inhibition of FLJ13615 (Accession NM_025114). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13615. FLJ22169 (Accession NM_024085) is another VGAM2674 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23525, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89973] Another function of VGAM2674 is therefore inhibition of FLJ22169 (Accession NM_024085). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_057169) is another VGAM2674 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:27685, SEQ ID:27698 and SEQ ID:16603 respectively, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89974] Another function of VGAM2674 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_057169). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. KIAA1789 (Accession XM_040486) is another VGAM2674 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33310, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89975] Another function of VGAM2674 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. KIAA1805 (Accession XM_086976) is another VGAM2674 host target gene. KIAA1805 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1805, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:39001, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89976] Another function of VGAM2674 is therefore inhibition of KIAA1805 (Accession XM_086976). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805. MGC15631 (Accession NM_032753) is another VGAM2674 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26495, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89977] Another function of VGAM2674 is therefore inhibition of MGC15631 (Accession NM_032753). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC15631. MGC5139 (Accession XM_058587) is another VGAM2674 host target gene. MGC5139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:36676, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89978] Another function of VGAM2674 is therefore inhibition of MGC5139 (Accession XM_058587). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714) is another VGAM2674 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE,

designated SEQ ID:8580, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89979] Another function of VGAM2674 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. RAB35, Member RAS Oncogene Family (RAB35, Accession NM_006861) is another VGAM2674 host target gene. RAB35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB35 BINDING SITE, designated SEQ ID:13735, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89980] Another function of VGAM2674 is therefore inhibition of RAB35, Member RAS Oncogene Family (RAB35, Accession NM_006861). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RAB35. Tripartite Motif-containing 26 (TRIM26, Accession NM_003449) is another VGAM2674 host target gene. TRIM26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM26 BINDING SITE, designated SEQ ID:9499, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89981] Another function of VGAM2674 is therefore inhibition of Tripartite Motif-containing 26 (TRIM26, Accession NM_003449). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM26. LOC137964 (Accession XM_059933) is another VGAM2674 host target gene. LOC137964 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC137964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137964 BINDING SITE, desig-

nated SEQ ID:37111, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89982] Another function of VGAM2674 is therefore inhibition of LOC137964 (Accession XM_059933). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137964. LOC144110 (Accession XM_084735) is another VGAM2674 host target gene. LOC144110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144110 BINDING SITE, designated SEQ ID:37680, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89983] Another function of VGAM2674 is therefore inhibition of LOC144110 (Accession XM_084735). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144110. LOC146226 (Accession XM_096946) is another VGAM2674 host target gene. LOC146226 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146226 BINDING SITE, designated SEQ ID:40663, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89984] Another function of VGAM2674 is therefore inhibition of LOC146226 (Accession XM_096946). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146226. LOC157922 (Accession XM_098841) is another VGAM2674 host target gene. LOC157922 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157922 BINDING SITE, designated SEQ ID:41889, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89985] Another function of VGAM2674 is therefore inhibition of

LOC157922 (Accession XM_098841). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157922. LOC158125 (Accession XM_088492) is another VGAM2674 host target gene. LOC158125 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158125 BINDING SITE, designated SEQ ID:39730, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89986] Another function of VGAM2674 is therefore inhibition of LOC158125 (Accession XM_088492). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158125. LOC221773 (Accession XM_165802) is another VGAM2674 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43764, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89987] Another function of VGAM2674 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. LOC257494 (Accession XM_175212) is another VGAM2674 host target gene. LOC257494 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257494 BINDING SITE, designated SEQ ID:46686, to the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, also designated SEQ ID:5385.

[89988] Another function of VGAM2674 is therefore inhibition of LOC257494 (Accession XM_175212). Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257494. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2675 (VGAM2675) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[89989] VGAM2675 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2675 was detected is described hereinabove with reference to Figs. 1-8.

[89990] VGAM2675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[89991] VGAM2675 gene encodes a VGAM2675 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2675 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2675 precursor RNA is designated SEQ ID:2661, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2661 is located at position 567 relative to the genome of Ophiostoma Mitovirus 3a.

[89992] VGAM2675 precursor RNA folds onto itself, forming VGAM2675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[89993] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2675 folded precursor RNA into VGAM2675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2675 RNA is designated SEQ ID:5386, and is provided hereinbelow with reference to the sequence listing part.

[89994] VGAM2675 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2675 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[89995] VGAM2675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2675 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2675 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2675 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[89996] The complementary binding of VGAM2675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2675 host target RNA into VGAM2675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[89997] It is appreciated that VGAM2675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2675 host target genes. The mRNA of each one of this plurality of VGAM2675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2675 RNA, herein designated VGAM RNA, and which when bound by VGAM2675 RNA causes inhibition of translation of respective one or more

VGAM2675 host target proteins.

[89998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2675 gene, herein designated VGAM GENE, on one or more VGAM2675 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[89999] It is yet further appreciated that a function of VGAM2675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of viral infection by Ophiostoma Mitovirus 3a.

Specific functions, and accordingly utilities, of VGAM2675 correlate with, and may be deduced from, the identity of the host target genes which VGAM2675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90000] Nucleotide sequences of the VGAM2675 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2675 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2675 are further described hereinbelow with reference to Table 1.

[90001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2675 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2675 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90002] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2675 gene, herein designated VGAM is inhibition of expression of VGAM2675 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2675 correlate with, and may be deduced from, the identity of the target genes which VGAM2675 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90003] Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is a VGAM2675 host target gene. PCDHA9 BINDING SITE1 and PCDHA9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE1 and PCDHA9 BINDING SITE2, designated SEQ ID:15210 and SEQ ID:25602 respectively, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90004] A function of VGAM2675 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM71.ARPP-19 (Accession NM_006628) is another VGAM2675 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13420, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90005] Another function of VGAM2675 is therefore inhibition of ARPP-19 (Accession NM_006628). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. ATPase, H+ Transporting, Lysosomal 56/58kDa, V1 Subunit B, Isoform 2 (ATP6V1B2, Accession NM_001693) is another VGAM2675 host target gene. ATP6V1B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP6V1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ATP6V1B2 BINDING SITE, designated SEQ ID:7414, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90006] Another function of VGAM2675 is therefore inhibition of ATPase, H+ Transporting, Lysosomal 56/58kDa, V1 Subunit B, Isoform 2 (ATP6V1B2, Accession NM_001693). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1B2. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172) is another VGAM2675 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30436, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90007] Another function of VGAM2675 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172). Accordingly, utilities of VGAM2675 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. FLJ13912 (Accession NM_022770) is another VGAM2675 host target gene. FLJ13912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13912 BINDING SITE, designated SEQ ID:23029, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90008] Another function of VGAM2675 is therefore inhibition of FLJ13912 (Accession NM_022770). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13912. FLJ20511 (Accession NM_017853) is another VGAM2675 host target gene. FLJ20511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20511

BINDING SITE, designated SEQ ID:19527, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90009] Another function of VGAM2675 is therefore inhibition of FLJ20511 (Accession NM_017853). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20511. HCA127 (Accession NM_018684) is another VGAM2675 host target gene. HCA127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCA127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA127 BINDING SITE, designated SEQ ID:20756, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90010] Another function of VGAM2675 is therefore inhibition of HCA127 (Accession NM_018684). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA127. LOC254057 (Accession XM_173085) is another VGAM2675 host target gene. LOC254057 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46345, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90011] Another function of VGAM2675 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC92935 (Accession XM_048197) is another VGAM2675 host target gene. LOC92935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92935 BINDING SITE, designated SEQ ID:35132, to the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, also designated SEQ ID:5386.

[90012] Another function of VGAM2675 is therefore inhibition of

LOC92935 (Accession XM_048197). Accordingly, utilities of VGAM2675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92935. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2676 (VGAM2676) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90013] VGAM2676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2676 was detected is described hereinabove with reference to Figs. 1-8.

[90014] VGAM2676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90015] VGAM2676 gene encodes a VGAM2676 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2676 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2676 precursor RNA is designated SEQ ID:2662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2662 is located at position 905 relative to the genome of Ophiostoma Mitovirus 3a.

[90016] VGAM2676 precursor RNA folds onto itself, forming VGAM2676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90017] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2676 folded precursor RNA into VGAM2676 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide se-

quence of VGAM2676 RNA is designated SEQ ID:5387, and is provided hereinbelow with reference to the sequence listing part.

[90018] VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2676 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90019] VGAM2676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2676 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90020] The complementary binding of VGAM2676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2676 host target RNA into VGAM2676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90021] It is appreciated that VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2676 host target genes. The mRNA of each one of this plurality of VGAM2676 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2676 RNA, herein designated VGAM RNA, and which when bound by VGAM2676 RNA causes inhibition of translation of respective one or more VGAM2676 host target proteins.

[90022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2676 gene, herein designated VGAM GENE, on one or more VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90023] It is yet further appreciated that a function of VGAM2676

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2676 include diagnosis, prevention and treatment of viral infection by Ophiostoma Mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2676 correlate with, and may be deduced from, the identity of the host target genes which VGAM2676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90024] Nucleotide sequences of the VGAM2676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2676 are further described hereinbelow with reference to Table 1.

[90025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2676 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90026] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2676 gene, herein designated VGAM is inhibition of expression of VGAM2676 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2676 correlate with, and may be deduced from, the identity of the target genes which VGAM2676 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90027] Kinesin-like 1 (KNSL1, Accession NM_004523) is a VGAM2676 host target gene. KNSL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KNSL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL1 BINDING SITE, designated SEQ ID:10862, to the nucleotide sequence of VGAM2676 RNA, herein designated VGAM RNA, also designated SEQ ID:5387.

[90028] A function of VGAM2676 is therefore inhibition of Kinesin-like 1 (KNSL1, Accession NM_004523), a gene which is a motor protein required for establishing a bipolar spindle. Accordingly, utilities of VGAM2676 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with KNSL1. The function of KNSL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM252.KIAA0254 (Accession NM_014758) is another VGAM2676 host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:16505, to the nucleotide sequence of VGAM2676 RNA, herein designated VGAM RNA, also designated SEQ ID:5387.

[90029] Another function of VGAM2676 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM2676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0254. Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM_006588) is another VGAM2676 host target gene. SULT1C2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SULT1C2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C2 BINDING SITE, designated SEQ ID:13351, to the nucleotide sequence of VGAM2676 RNA, herein designated VGAM RNA, also designated SEQ ID:5387.

[90030] Another function of VGAM2676 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM_006588). Accordingly, utilities of VGAM2676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C2. LOC144519 (Accession XM_084890) is another VGAM2676 host target gene. LOC144519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37755, to the nucleotide sequence of VGAM2676 RNA, herein designated VGAM RNA, also designated SEQ ID:5387.

[90031] Another function of VGAM2676 is therefore inhibition of LOC144519 (Accession XM_084890). Accordingly, utilities

of VGAM2676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2677 (VGAM2677) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90032] VGAM2677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2677 was detected is described hereinabove with reference to Figs. 1-8.

[90033] VGAM2677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Mitovirus 3a. VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90034] VGAM2677 gene encodes a VGAM2677 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2677 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2677 precursor RNA is designated SEQ ID:2663, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2663 is located at position 1465 relative to the genome of Ophiostoma Mitovirus 3a.

[90035] VGAM2677 precursor RNA folds onto itself, forming VGAM2677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90036] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2677 folded precursor RNA into VGAM2677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2677 RNA is designated SEQ ID:5388, and

is provided hereinbelow with reference to the sequence listing part.

[90037] VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2677 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90038] VGAM2677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2677 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2677 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90039] The complementary binding of VGAM2677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2677 host target RNA into VGAM2677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90040] It is appreciated that VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2677 host target genes. The mRNA of each one of this plurality of VGAM2677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2677 RNA, herein designated VGAM RNA, and which when bound by VGAM2677 RNA causes inhibition of translation of respective one or more VGAM2677 host target proteins.

[90041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2677 gene, herein designated VGAM GENE, on one or more VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90042] It is yet further appreciated that a function of VGAM2677 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2677 include diagnosis, prevention and treatment of viral infection by Ophiostoma Mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2677 correlate with, and may be deduced from, the identity of the host target genes which VGAM2677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90043] Nucleotide sequences of the VGAM2677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2677 are further described hereinbelow with reference to Table 1.

[90044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2677 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2677 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90045] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2677 gene, herein designated VGAM is inhibition of expression of VGAM2677 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2677 correlate with, and may be deduced from, the identity of the target genes which VGAM2677 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90046] Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM_006452) is a VGAM2677 host target gene. PAICS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13162, to the nucleotide sequence of VGAM2677 RNA, herein designated VGAM RNA, also designated SEQ ID:5388.

[90047] A function of VGAM2677 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM2677

include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function of PAICS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.KIAA0844 (Accession NM_014951) is another VGAM2677 host target gene. KIAA0844 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0844 BINDING SITE, designated SEQ ID:17284, to the nucleotide sequence of VGAM2677 RNA, herein designated VGAM RNA, also designated SEQ ID:5388.

[90048] Another function of VGAM2677 is therefore inhibition of KIAA0844 (Accession NM_014951). Accordingly, utilities of VGAM2677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0844. LOC126669 (Accession XM_060121) is another VGAM2677 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37153, to the nucleotide sequence of VGAM2677 RNA, herein designated VGAM RNA, also designated SEQ ID:5388.

[90049] Another function of VGAM2677 is therefore inhibition of LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM2677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC145644 (Accession XM_035608) is another VGAM2677 host target gene. LOC145644 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145644 BINDING SITE, designated SEQ ID:32289, to the nucleotide sequence of VGAM2677 RNA, herein designated VGAM RNA, also designated SEQ ID:5388.

[90050] Another function of VGAM2677 is therefore inhibition of LOC145644 (Accession XM_035608). Accordingly, utilities of VGAM2677 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145644. LOC90829 (Accession XM_034325) is another VGAM2677 host target gene. LOC90829 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90829 BINDING SITE, designated SEQ ID:32055, to the nucleotide sequence of VGAM2677 RNA, herein designated VGAM RNA, also designated SEQ ID:5388.

[90051] Another function of VGAM2677 is therefore inhibition of LOC90829 (Accession XM_034325). Accordingly, utilities of VGAM2677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90829. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2678 (VGAM2678) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90052] VGAM2678 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2678 was detected is described hereinabove with reference to Figs. 1-8.

[90053] VGAM2678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld. VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90054] VGAM2678 gene encodes a VGAM2678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2678 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2678 precursor RNA is designated SEQ ID:2664, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2664 is located at position 1520 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld.

[90055] VGAM2678 precursor RNA folds onto itself, forming VGAM2678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90056] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2678 folded precursor RNA into VGAM2678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2678 RNA is designated SEQ ID:5389, and is provided hereinbelow with reference to the sequence listing part.

[90057] VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2678 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90058] VGAM2678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2678 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2678 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90059] The complementary binding of VGAM2678 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2678 host target RNA into VGAM2678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90060] It is appreciated that VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2678 host target genes. The mRNA of each one of this plurality of VGAM2678 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2678 RNA, herein designated VGAM RNA, and which when bound by VGAM2678 RNA causes inhibition of translation of respective one or more VGAM2678 host target proteins.

[90061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2678 gene, herein designated VGAM GENE, on one or more VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90062] It is yet further appreciated that a function of VGAM2678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 4-Ld. Specific functions, and accordingly utilities, of VGAM2678 correlate with, and may be deduced from, the identity of the host target genes which VGAM2678 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90063] Nucleotide sequences of the VGAM2678 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2678 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2678 are further described hereinbelow with reference to Table 1.

[90064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2678 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2678 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90065] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2678 gene, herein designated VGAM is inhibition of expression of VGAM2678 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2678 correlate with, and may be deduced from, the identity of the target genes which VGAM2678 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90066] Jagged 2 (JAG2, Accession NM_002226) is a VGAM2678 host target gene. JAG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by JAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG2 BINDING SITE, designated SEQ ID:8008, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90067] A function of VGAM2678 is therefore inhibition of Jagged 2 (JAG2, Accession NM_002226), a gene which is a putative notch ligand involved in the mediation of notch signaling. Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG2. The function of JAG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM136.Mab-21-like 1 (C. elegans) (MAB21L1, Accession NM_005584) is another VGAM2678 host target gene. MAB21L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAB21L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MAB21L1 BINDING SITE, designated SEQ ID:12114, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90068] Another function of VGAM2678 is therefore inhibition of Mab-21-like 1 (C. elegans) (MAB21L1, Accession NM_005584), a gene which may control cerebellum and eye development; very strongly similar to murine Mm.10798. Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L1. The function of MAB21L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.Myotubular Myopathy 1 (MTM1, Accession NM_000252) is another VGAM2678 host target gene. MTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTM1 BINDING SITE, designated SEQ ID:5793, to the nucleotide sequence of VGAM2678 RNA, herein

designated VGAM RNA, also designated SEQ ID:5389.

[90069] Another function of VGAM2678 is therefore inhibition of Myotubular Myopathy 1 (MTM1, Accession NM_000252). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTM1. Von Hippel-Lindau Syndrome (VHL, Accession NM_000551) is another VGAM2678 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6166, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90070] Another function of VGAM2678 is therefore inhibition of Von Hippel-Lindau Syndrome (VHL, Accession NM_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM197.ANKT (Accession NM_016359) is another VGAM2678 host target gene. ANKT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANKT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKT BINDING SITE, designated SEQ ID:18500, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90071] Another function of VGAM2678 is therefore inhibition of ANKT (Accession NM_016359). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKT. DKFZP761L0424 (Accession XM_166112) is another VGAM2678 host target gene. DKFZP761L0424 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761L0424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761L0424 BINDING SITE, designated

SEQ ID:43892, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90072] Another function of VGAM2678 is therefore inhibition of DKFZP761L0424 (Accession XM_166112). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761L0424. FLJ10852 (Accession NM_019028) is another VGAM2678 host target gene. FLJ10852 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10852 BINDING SITE, designated SEQ ID:21118, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90073] Another function of VGAM2678 is therefore inhibition of FLJ10852 (Accession NM_019028). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10852. FLJ22054 (Accession XM_170478) is another VGAM2678 host target gene. FLJ22054 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22054 BINDING SITE, designated SEQ ID:45320, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90074] Another function of VGAM2678 is therefore inhibition of FLJ22054 (Accession XM_170478). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22054. FLJ23259 (Accession NM_024727) is another VGAM2678 host target gene. FLJ23259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23259 BINDING SITE, designated SEQ ID:24064, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90075] Another function of VGAM2678 is therefore inhibition of

FLJ23259 (Accession NM_024727). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23259. HSMPP8 (Accession XM_167894) is another VGAM2678 host target gene. HSMPP8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSMPP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:44906, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90076] Another function of VGAM2678 is therefore inhibition of HSMPP8 (Accession XM_167894). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8. KIAA1014 (Accession XM_037205) is another VGAM2678 host target gene. KIAA1014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1014 BINDING SITE, designated SEQ ID:32572, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90077] Another function of VGAM2678 is therefore inhibition of KIAA1014 (Accession XM_037205). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1014. MGC35558 (Accession NM_145013) is another VGAM2678 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29618, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90078] Another function of VGAM2678 is therefore inhibition of MGC35558 (Accession NM_145013). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. Spir-1 (Accession XM_035640) is another

VGAM2678 host target gene. Spir-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Spir-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Spir-1 BINDING SITE, designated SEQ ID:32309, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90079] Another function of VGAM2678 is therefore inhibition of Spir-1 (Accession XM_035640). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Spir-1. ZFD25 (Accession NM_016220) is another VGAM2678 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18326, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90080] Another function of VGAM2678 is therefore inhibition of ZFD25 (Accession NM_016220). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. LOC157503 (Accession XM_098767) is another VGAM2678 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41816, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90081] Another function of VGAM2678 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. LOC201475 (Accession XM_113967) is another VGAM2678 host target gene. LOC201475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201475, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201475 BINDING SITE, designated SEQ ID:42579, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90082] Another function of VGAM2678 is therefore inhibition of LOC201475 (Accession XM_113967). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201475. LOC221814 (Accession XM_168226) is another VGAM2678 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45098, to the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, also designated SEQ ID:5389.

[90083] Another function of VGAM2678 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221814. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2679 (VGAM2679) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90084] VGAM2679 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2679 was detected is described hereinabove with reference to Figs. 1-8.

[90085] VGAM2679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld. VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90086] VGAM2679 gene encodes a VGAM2679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2679 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2679 precursor RNA is designated SEQ ID:2665, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2665 is located at position 676 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld.

[90087] VGAM2679 precursor RNA folds onto itself, forming VGAM2679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90088] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2679 folded precursor RNA into VGAM2679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2679 RNA is designated SEQ ID:5390, and is provided hereinbelow with reference to the sequence listing part.

[90089] VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2679 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90090] VGAM2679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2679 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2679 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90091] The complementary binding of VGAM2679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2679 host target RNA into VGAM2679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90092] It is appreciated that VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2679 host target genes. The mRNA of each one of this plurality of VGAM2679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2679 RNA, herein designated VGAM RNA, and which when bound by VGAM2679 RNA causes

inhibition of translation of respective one or more VGAM2679 host target proteins.

[90093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2679 gene, herein designated VGAM GENE, on one or more VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90094] It is yet further appreciated that a function of VGAM2679 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2679 include diagnosis, prevention and

treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 4-Ld. Specific functions, and accordingly utilities, of VGAM2679 correlate with, and may be deduced from, the identity of the host target genes which VGAM2679 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90095] Nucleotide sequences of the VGAM2679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2679 are further described hereinbelow with reference to Table 1.

[90096] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2679 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90097] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2679 gene, herein designated VGAM is inhibition of expression of VGAM2679 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2679 correlate with, and may be deduced from, the identity of the target genes which VGAM2679 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90098] Basic Transcription Element Binding Protein 1 (BTEB1, Accession NM_001206) is a VGAM2679 host target gene. BTEB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTEB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTEB1 BINDING SITE, designated SEQ ID:6871, to the nucleotide sequence of VGAM2679 RNA, herein designated VGAM RNA, also designated SEQ ID:5390.

[90099] A function of VGAM2679 is therefore inhibition of Basic Transcription Element Binding Protein 1 (BTEB1, Accession NM_001206). Accordingly, utilities of VGAM2679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTEB1. Nuclear Protein, Ataxia-telangiectasia Locus (NPAT, Accession XM_040846) is another VGAM2679 host target gene. NPAT BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by NPAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPAT BINDING SITE, designated SEQ ID:33387, to the nucleotide sequence of VGAM2679 RNA, herein designated VGAM RNA, also designated SEQ ID:5390.

[90100] Another function of VGAM2679 is therefore inhibition of Nuclear Protein, Ataxia-telangiectasia Locus (NPAT, Accession XM_040846), a gene which is expressed in all tissues. Accordingly, utilities of VGAM2679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPAT. The function of NPAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM376.PRO0641 (Accession NM_014135) is another VGAM2679 host target gene. PRO0641 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0641 BINDING SITE, designated

SEQ ID:15401, to the nucleotide sequence of VGAM2679 RNA, herein designated VGAM RNA, also designated SEQ ID:5390.

[90101] Another function of VGAM2679 is therefore inhibition of PRO0641 (Accession NM_014135). Accordingly, utilities of VGAM2679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0641. RAB14, Member RAS Oncogene Family (RAB14, Accession NM_016322) is another VGAM2679 host target gene. RAB14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB14 BINDING SITE, designated SEQ ID:18450, to the nucleotide sequence of VGAM2679 RNA, herein designated VGAM RNA, also designated SEQ ID:5390.

[90102] Another function of VGAM2679 is therefore inhibition of RAB14, Member RAS Oncogene Family (RAB14, Accession NM_016322). Accordingly, utilities of VGAM2679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB14. Wingless-type

MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_004185) is another VGAM2679 host target gene. WNT2B BINDING SITE1 and WNT2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT2B BINDING SITE1 and WNT2B BINDING SITE2, designated SEQ ID:10392 and SEQ ID:23693 respectively, to the nucleotide sequence of VGAM2679 RNA, herein designated VGAM RNA, also designated SEQ ID:5390.

[90103] Another function of VGAM2679 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_004185). Accordingly, utilities of VGAM2679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT2B. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2680 (VGAM2680) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90104] VGAM2680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2680 was detected is described hereinabove with reference to Figs. 1-8.

[90105] VGAM2680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld. VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90106] VGAM2680 gene encodes a VGAM2680 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2680 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2680 precursor RNA is designated SEQ ID:2666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2666 is located at position 316 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld.

[90107] VGAM2680 precursor RNA folds onto itself, forming VGAM2680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90108] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2680 folded precursor RNA into VGAM2680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2680 RNA is designated SEQ ID:5391, and is provided hereinbelow with reference to the sequence listing part.

[90109] VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2680 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[90110] VGAM2680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2680 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2680 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90111] The complementary binding of VGAM2680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2680 host target RNA into VGAM2680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90112] It is appreciated that VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2680 host target genes. The mRNA of each one of this plurality of VGAM2680 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2680 RNA, herein designated VGAM RNA, and which when bound by VGAM2680 RNA causes inhibition of translation of respective one or more VGAM2680 host target proteins.

[90113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2680 gene, herein designated VGAM GENE, on one or more VGAM2680 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90114] It is yet further appreciated that a function of VGAM2680 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 4-Ld. Specific functions, and accordingly utilities, of VGAM2680 correlate with, and may be deduced from, the identity of the host target genes which VGAM2680 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90115] Nucleotide sequences of the VGAM2680 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2680 are further described hereinbelow with reference to Table 1.

[90116] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2680 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90117] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2680 gene, herein designated VGAM is inhibition of expression of VGAM2680 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2680 correlate with, and may be deduced from, the identity of the target genes which VGAM2680 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90118] A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM_001110) is a VGAM2680 host target gene.

ADAM10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:6767, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90119] A function of VGAM2680 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM_001110), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10. The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM706.Calcium Channel, Voltage-dependent, Gamma Subunit 2 (CACNG2, Accession NM_006078) is another VGAM2680 host target gene. CACNG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

CACNG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG2 BINDING SITE, designated SEQ ID:12724, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90120] Another function of VGAM2680 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 2 (CACNG2, Accession NM_006078), a gene which is thought to stabilize the calcium channel in an inactivated (closed) state. Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG2. The function of CACNG2 has been established by previous studies. Chen et al. (2000) found that stargazer, an ataxic and epileptic mutant mouse, lacks functional AMPA receptors on cerebellar granule cells. Stargazin, the mutant protein, interacts with both AMPA receptor subunits and synaptic PDZ proteins, such as PSD95 (OMIM Ref. No. 602887). Chen et al. (2000) found that the interaction of stargazin with AMPA receptor subunits is essential for delivering functional receptors to the surface membrane of granule cells,

whereas its binding with PSD95 and related PDZ proteins through a carboxy-terminal PDZ-binding domain is required for targeting the AMPA receptor to synapses. Expression of a mutant stargazin lacking the PDZ-binding domain in hippocampal pyramidal cells disrupts synaptic AMPA receptors, indicating that stargazin-like mechanisms for targeting AMPA receptors may be widespread in the central nervous syste. By searching an EST database for sequences homologous to mouse Cacng2, followed by PCR of a cerebellum cDNA library, Black and Lennon (1999) identified a cDNA encoding human CACNG2. The deduced 315-amino acid CACNG2 transmembrane protein is 98% identical to CACGN3 (OMIM Ref. No. 606403) and mouse Cacng2, but only 18% identical to CACNG1 (OMIM Ref. No. 114209).

[90121] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[90122] Chen, L.; Chetkovich, D. M.; Petralla, R. S.; Sweeney, N. T.; Kawasaki, Y.; Wenthold, R. J.; Bredt, D. S.; Nicoli, R. A. : Stargazin regulates synaptic targeting of AMPA receptors by two distinct mechanisms. Nature 408: 936-943, 2000. ; and

[90123] Black, J. L., III; Lennon, V. A. : Identification and cloning of putative human neuronal voltage-gated calcium channel gamma-2 and gamma-3 subunits: neurologic implications. Mayo Clin.

[90124] Further studies establishing the function and utilities of CACNG2 are found in John Hopkins OMIM database record ID 602911, and in sited publications numbered 6188-6190 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM_012158) is another VGAM2680 host target gene. FBXL3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXL3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL3A BINDING SITE, designated SEQ ID:14458, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90125] Another function of VGAM2680 is therefore inhibition of F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM_012158), a gene which is a putative SCF ubiq-

uitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL3A. The function of FBXL3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1172.Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542) is another VGAM2680 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45227, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90126] Another function of VGAM2680 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM2680 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174.Phosphorylase, Glycogen; Brain (PYGB, Accession NM_002862) is another VGAM2680 host target gene. PYGB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PYGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGB BINDING SITE, designated SEQ ID:8765, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90127] Another function of VGAM2680 is therefore inhibition of Phosphorylase, Glycogen; Brain (PYGB, Accession NM_002862). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGB. DKFZp564K142 (Accession NM_032121) is another VGAM2680 host target gene. DKFZp564K142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by DKFZp564K142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:25806, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90128] Another function of VGAM2680 is therefore inhibition of DKFZp564K142 (Accession NM_032121). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142. KIAA0429 (Accession NM_014751) is another VGAM2680 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16470, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90129] Another function of VGAM2680 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities

of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA1691 (Accession XM_166523) is another VGAM2680 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44465, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90130] Another function of VGAM2680 is therefore inhibition of KIAA1691 (Accession XM_166523). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. MGC3248 (Accession NM_032486) is another VGAM2680 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248

BINDING SITE, designated SEQ ID:26233, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90131] Another function of VGAM2680 is therefore inhibition of MGC3248 (Accession NM_032486). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. Monocyte to Macrophage Differentiation-associated (MMD, Accession XM_008269) is another VGAM2680 host target gene. MMD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMD BINDING SITE, designated SEQ ID:30077, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90132] Another function of VGAM2680 is therefore inhibition of Monocyte to Macrophage Differentiation-associated (MMD, Accession XM_008269). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMD.

Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127) is another VGAM2680 host target gene. PMAIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PMAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMAIP1 BINDING SITE, designated SEQ ID:22103, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90133] Another function of VGAM2680 is therefore inhibition of Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMAIP1. PRO0611 (Accession NM_014076) is another VGAM2680 host target gene. PRO0611 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0611

BINDING SITE, designated SEQ ID:15303, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90134] Another function of VGAM2680 is therefore inhibition of PRO0611 (Accession NM_014076). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0611. SE57-1 (Accession NM_025214) is another VGAM2680 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24891, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90135] Another function of VGAM2680 is therefore inhibition of SE57-1 (Accession NM_025214). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. LOC127255 (Accession NM_145258) is another VGAM2680 host target gene. LOC127255 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127255 BINDING SITE, designated SEQ ID:29775, to the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, also designated SEQ ID:5391.

[90136] Another function of VGAM2680 is therefore inhibition of LOC127255 (Accession NM_145258). Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127255. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2681 (VGAM2681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90137] VGAM2681 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2681 was detected is described hereinabove with reference to Figs. 1-8.

[90138] VGAM2681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld. VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90139] VGAM2681 gene encodes a VGAM2681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2681 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2681 precursor RNA is designated SEQ ID:2667, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2667 is located at position 2192 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld.

[90140] VGAM2681 precursor RNA folds onto itself, forming VGAM2681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[90141] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2681 folded precursor RNA into VGAM2681 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2681 RNA is designated SEQ ID:5392, and is provided hereinbelow with reference to the sequence listing part.

[90142] VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2681 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90143] VGAM2681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2681 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2681 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90144] The complementary binding of VGAM2681 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2681 host target RNA into VGAM2681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90145] It is appreciated that VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2681 host target genes. The mRNA of each one of this plurality of VGAM2681 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2681 RNA, herein designated VGAM RNA, and which when bound by VGAM2681 RNA causes inhibition of translation of respective one or more VGAM2681 host target proteins.

[90146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2681 gene, herein designated VGAM GENE, on one or more VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90147] It is yet further appreciated that a function of VGAM2681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2681 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 4-Ld. Specific functions, and accordingly utilities, of VGAM2681 correlate with, and may be deduced from, the identity of the host target genes which VGAM2681 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90148] Nucleotide sequences of the VGAM2681 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2681 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2681 are further described hereinbelow with reference to Table 1.

[90149] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2681 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2681 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90150] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2681 gene, herein designated VGAM is inhibition of expression of VGAM2681 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2681 correlate with, and may be deduced from, the identity of the target genes which VGAM2681 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90151] FLJ13456 (Accession XM_038291) is a VGAM2681 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32797, to the nucleotide sequence of VGAM2681 RNA, herein designated VGAM RNA, also designated SEQ ID:5392.

[90152] A function of VGAM2681 is therefore inhibition of FLJ13456 (Accession XM_038291). Accordingly, utilities of VGAM2681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. KIAA1979 (Accession XM_113984) is another VGAM2681 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42590, to the nucleotide sequence of VGAM2681 RNA, herein designated VGAM RNA, also designated SEQ ID:5392.

[90153] Another function of VGAM2681 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM2681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1979. MGC32104 (Accession NM_144684) is another

VGAM2681 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29501, to the nucleotide sequence of VGAM2681 RNA, herein designated VGAM RNA, also designated SEQ ID:5392.

[90154] Another function of VGAM2681 is therefore inhibition of MGC32104 (Accession NM_144684). Accordingly, utilities of VGAM2681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2682 (VGAM2682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90155] VGAM2682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2682 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[90156] VGAM2682 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld. VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90157] VGAM2682 gene encodes a VGAM2682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2682 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2682 precursor RNA is designated SEQ ID:2668, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2668 is located at position 1099 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld.

[90158] VGAM2682 precursor RNA folds onto itself, forming VGAM2682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90159] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2682 folded precursor RNA into VGAM2682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2682 RNA is designated SEQ ID:5393, and is provided hereinbelow with reference to the sequence listing part.

[90160] VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2682 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90161] VGAM2682 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2682 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90162] The complementary binding of VGAM2682 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2682 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2682 host target RNA into VGAM2682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90163] It is appreciated that VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2682 host target genes. The mRNA of each one of this plurality of VGAM2682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2682 RNA, herein designated VGAM RNA, and which when bound by VGAM2682 RNA causes inhibition of translation of respective one or more VGAM2682 host target proteins.

[90164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2682 gene, herein designated VGAM GENE, on one or more VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90165] It is yet further appreciated that a function of VGAM2682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 4-Ld. Specific functions, and accordingly utilities, of VGAM2682 correlate with, and may be deduced from, the identity of the host target genes which VGAM2682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90166] Nucleotide sequences of the VGAM2682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2682 are further described hereinbelow with reference to Table 1.

[90167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2682 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2682 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90168] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2682 gene, herein designated VGAM is inhibition of expression of VGAM2682 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2682 correlate with, and may be deduced from, the identity of the target genes which VGAM2682 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90169] Fc Fragment of IgA, Receptor For (FCAR, Accession NM_002000) is a VGAM2682 host target gene. FCAR BINDING SITE1 through FCAR BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCAR, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE7, designated SEQ ID:7729, SEQ ID:28429, SEQ ID:28431, SEQ ID:28434, SEQ ID:28435, SEQ ID:28425 and SEQ ID:28427 respectively, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90170] A function of VGAM2682 is therefore inhibition of Fc Fragment of IgA, Receptor For (FCAR, Accession NM_002000), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCAR. The function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Eta Polypeptide (YWHAH, Accession NM_003405) is another VGAM2682 host target gene. YWHAH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by YWHAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAH BINDING SITE, designated SEQ ID:9440, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90171] Another function of VGAM2682 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Eta Polypeptide (YWHAH, Accession NM_003405), a gene which activates tyrosine and tryptophan hydroxylases in the presence of and strongly activates protein kinase c. Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAH. The function of YWHAH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923.Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394) is another VGAM2682 host target gene. ZNF10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF10, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF10 BINDING SITE, designated SEQ ID:17697, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90172] Another function of VGAM2682 is therefore inhibition of Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394), a gene which may function as a transcriptional regulator. Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF10. The function of ZNF10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36.DC8 (Accession NM_015471) is another VGAM2682 host target gene. DC8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC8 BINDING SITE, designated SEQ ID:17752, to the nucleotide sequence of VGAM2682 RNA, herein

designated VGAM RNA, also designated SEQ ID:5393.

[90173] Another function of VGAM2682 is therefore inhibition of DC8 (Accession NM_015471). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC8. DNA Cross-link Repair 1A (PSO2 homolog, S. cerevisiae) (DCLRE1A, Accession XM_044815) is another VGAM2682 host target gene. DCLRE1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCLRE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCLRE1A BINDING SITE, designated SEQ ID:34283, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90174] Another function of VGAM2682 is therefore inhibition of DNA Cross-link Repair 1A (PSO2 homolog, S. cerevisiae) (DCLRE1A, Accession XM_044815). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCLRE1A. FLJ10704 (Accession NM_018185) is another VGAM2682 host target gene. FLJ10704 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:20035, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90175] Another function of VGAM2682 is therefore inhibition of FLJ10704 (Accession NM_018185). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. FLJ23151 (Accession NM_024772) is another VGAM2682 host target gene. FLJ23151 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23151 BINDING SITE, designated SEQ ID:24136, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90176] Another function of VGAM2682 is therefore inhibition of

FLJ23151 (Accession NM_024772). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23151. Nucleoporin 160kDa (NUP160, Accession XM_113678) is another VGAM2682 host target gene. NUP160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUP160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP160 BINDING SITE, designated SEQ ID:42328, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90177] Another function of VGAM2682 is therefore inhibition of Nucleoporin 160kDa (NUP160, Accession XM_113678). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP160. LOC151996 (Accession XM_098151) is another VGAM2682 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41417, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90178] Another function of VGAM2682 is therefore inhibition of LOC151996 (Accession XM_098151). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC221596 (Accession XM_166331) is another VGAM2682 host target gene. LOC221596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221596 BINDING SITE, designated SEQ ID:44173, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90179] Another function of VGAM2682 is therefore inhibition of LOC221596 (Accession XM_166331). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221596. LOC256073 (Accession XM_172972) is another VGAM2682 host target gene. LOC256073 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256073 BINDING SITE, designated SEQ ID:46231, to the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, also designated SEQ ID:5393.

[90180] Another function of VGAM2682 is therefore inhibition of LOC256073 (Accession XM_172972). Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2683 (VGAM2683) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90181] VGAM2683 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2683 was detected is described hereinabove with reference to Figs. 1-8.

[90182] VGAM2683 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld. VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90183] VGAM2683 gene encodes a VGAM2683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2683 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2683 precursor RNA is designated SEQ ID:2669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2669 is located at position 2286 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 4-Ld.

[90184] VGAM2683 precursor RNA folds onto itself, forming VGAM2683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90185] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2683 folded precursor RNA into VGAM2683 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2683 RNA is designated SEQ ID:5394, and is provided hereinbelow with reference to the sequence listing part.

[90186] VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2683 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90187] VGAM2683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2683 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90188] The complementary binding of VGAM2683 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2683 host target RNA into VGAM2683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90189] It is appreciated that VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2683 host target genes. The mRNA of each one of this plurality of VGAM2683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2683 RNA, herein designated VGAM RNA, and which when bound by VGAM2683 RNA causes inhibition of translation of respective one or more VGAM2683 host target proteins.

[90190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2683 gene, herein designated VGAM GENE, on one or more VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90191] It is yet further appreciated that a function of VGAM2683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 4-Ld. Specific functions, and accordingly utilities, of VGAM2683 correlate with, and may be deduced from, the identity of the host target genes which VGAM2683 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90192] Nucleotide sequences of the VGAM2683 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2683 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2683 are further described hereinbelow with reference to Table 1.

[90193] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2683 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90194] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2683 gene, herein designated VGAM is inhibition of expression of VGAM2683 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2683 correlate with, and may be deduced from, the identity of the target genes which VGAM2683 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90195] Glucosamine (N-acetyl)-6-sulfatase (Sanfilippo disease IIID) (GNS, Accession NM_002076) is a VGAM2683 host target gene. GNS BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by GNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNS BINDING SITE, designated SEQ ID:7855, to the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, also designated SEQ ID:5394.

[90196] A function of VGAM2683 is therefore inhibition of Glucosamine (N-acetyl)-6-sulfatase (Sanfilippo disease IIID) (GNS, Accession NM_002076), a gene which hydrolyzes sulfate groups from glycosaminoglycans. Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNS. The function of GNS has been established by previous studies. Kresse et al. (1980) found that cultured skin fibroblasts from 2 patients with clinical features of the Sanfilippo syndrome accumulated excessive amounts of heparan sulfate and were unable to release sulfate from N-acetylglucosamine-6-sulfate linkages in heparan sulfate-derived oligosaccharides. Keratan sulfate-derived oligosaccharides bearing the same residue at the nonreducing end were normally degraded. Kinetic differences between the sulfatase activities of normal fibroblasts were

found. Thus, the N-acetylglucosamine-6-sulfate sulfatases degrading heparan sulfate and keratan sulfate are distinct. The activity directed against heparan sulfate is deficient in the new form of Sanfilippo syndrome, designated type D by Kresse et al. (1980). The fibroblasts were from a 7-year-old East Indian boy living in England and a 4-year-old girl from Sardinia. Both patients excreted excessive heparan sulfate in the urine. The boy was mentally retarded and had 'characteristic behavioral disturbances.' The girl showed coarse facies and hirsutism but was not mentally retarded. Gatti et al. (1982) concluded that MPS IIID cannot be distinguished clinically from the other forms of Sanfilippo syndrome. Autosomal recessive inheritance was considered confirmed. Stating that only 2 cases of MPS IIID had been reported in detail, Coppa et al. (1983) added 2 more. Both patients had a high percentage of heparan sulfate in the urinary glycosaminoglycans and severe deficiency of N-acetylglucosamine-6-sulfate sulfatase in cultured skin fibroblasts. One of the patients, who presented at age 9 years 8 months with a history of chronic diarrhea, was only mildly retarded. Kaplan and Wolfe (1987) reported the first cases of type D from North America--2 relatively mildly affected brothers. Neufeld

(1987) suggested that for the sake of simplicity the enzyme deficient in this disorder be termed N-acetylglucosamine 6-sulfatase. Freeman et al. (1987) reported purification and characterization of the enzyme deficient in MPS IIID. They identified 4 forms of the enzyme in liver, which were postulated to be due to differences in the state of processing of a large subunit. The catalytic properties were studied by Freeman and Hopwood (1987). Robertson et al. (1988) pointed out homology in nucleotide sequence to steroid sulfatase (OMIM Ref. No. 308100), a microsomal enzyme.

[90197] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[90198] Freeman, C.; Clements, P. R.; Hopwood, J. J. : Human liver N-acetylglucosamine-6-sulphate sulphatase: purification and characterization. Biochem. J. 246: 347-354, 1987. ; and

[90199] Kresse, H.; Paschke, E.; von Figura, K.; Gilberg, W.; Fuchs, W. : Sanfilippo disease type D: deficiency of N-acetylglucosamine-6-sulfate sulfatase required for heparan sulfate degradati.

[90200] Further studies establishing the function and utilities of

GNS are found in John Hopkins OMIM database record ID 252940, and in sited publications numbered 9242-9248, 656 and 9249-9252 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Myotubular Myopathy 1 (MTM1, Accession NM_000252) is another VGAM2683 host target gene. MTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTM1 BINDING SITE, designated SEQ ID:5789, to the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, also designated SEQ ID:5394.

[90201] Another function of VGAM2683 is therefore inhibition of Myotubular Myopathy 1 (MTM1, Accession NM_000252). Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTM1. Chromosome 11 Open Reading Frame 21 (C11orf21, Accession NM_014144) is another VGAM2683 host target gene. C11orf21 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf21, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf21 BINDING SITE, designated SEQ ID:15425, to the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, also designated SEQ ID:5394.

[90202] Another function of VGAM2683 is therefore inhibition of Chromosome 11 Open Reading Frame 21 (C11orf21, Accession NM_014144). Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf21. Chromosome 20 Open Reading Frame 38 (C20orf38, Accession NM_018327) is another VGAM2683 host target gene. C20orf38 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf38 BINDING SITE, designated SEQ ID:20322, to the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, also designated SEQ ID:5394.

[90203] Another function of VGAM2683 is therefore inhibition of

Chromosome 20 Open Reading Frame 38 (C20orf38, Accession NM_018327). Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf38. DREV1 (Accession NM_016025) is another VGAM2683 host target gene. DREV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DREV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DREV1 BINDING SITE, designated SEQ ID:18107, to the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, also designated SEQ ID:5394.

[90204] Another function of VGAM2683 is therefore inhibition of DREV1 (Accession NM_016025). Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DREV1. FLJ10493 (Accession NM_018112) is another VGAM2683 host target gene. FLJ10493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10493 BINDING SITE, designated SEQ ID:19884, to the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, also designated SEQ ID:5394.

[90205] Another function of VGAM2683 is therefore inhibition of FLJ10493 (Accession NM_018112). Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10493. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2684 (VGAM2684) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90206] VGAM2684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2684 was detected is described hereinabove with reference to Figs. 1-8.

[90207] VGAM2684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 5-Ld. VGAM2684 host target gene, herein des-

ignated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90208] VGAM2684 gene encodes a VGAM2684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2684 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2684 precursor RNA is designated SEQ ID:2670, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2670 is located at position 706 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 5-Ld.

[90209] VGAM2684 precursor RNA folds onto itself, forming VGAM2684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90210] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2684 folded precursor RNA into VGAM2684

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2684 RNA is designated SEQ ID:5395, and is provided hereinbelow with reference to the sequence listing part.

[90211] VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2684 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90212] VGAM2684 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2684 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90213] The complementary binding of VGAM2684 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2684 host target RNA into VGAM2684 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[90214] It is appreciated that VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2684 host target genes. The mRNA of each one of this plurality of VGAM2684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2684 RNA, herein designated VGAM RNA, and which when bound by VGAM2684 RNA causes inhibition of translation of respective one or more VGAM2684 host target proteins.

[90215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2684 gene, herein designated VGAM GENE, on one or more VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90216] It is yet further appreciated that a function of VGAM2684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 5-Ld. Specific functions, and accordingly utilities, of VGAM2684 correlate with, and may be deduced from, the identity of the host target genes which VGAM2684 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90217] Nucleotide sequences of the VGAM2684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2684 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2684 are further described hereinbelow with reference to Table 1.

[90218] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2684 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90219] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2684 gene, herein designated VGAM is inhibition of expression of VGAM2684 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2684 correlate with, and may be deduced from, the identity of the target genes which VGAM2684 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90220] Chediak-Higashi Syndrome 1 (CHS1, Accession NM_000081) is a VGAM2684 host target gene. CHS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHS1 BINDING SITE, designated SEQ ID:5526, to the nucleotide sequence of VGAM2684 RNA, herein designated

VGAM RNA, also designated SEQ ID:5395.

[90221] A function of VGAM2684 is therefore inhibition of Chediak-Higashi Syndrome 1 (CHS1, Accession NM_000081), a gene which may sort endosomal resident proteins into late multivesicular endosome. Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHS1. The function of CHS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Homeo Box C11 (HOXC11, Accession XM_012215) is another VGAM2684 host target gene. HOXC11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXC11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC11 BINDING SITE, designated SEQ ID:30209, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90222] Another function of VGAM2684 is therefore inhibition of Homeo Box C11 (HOXC11, Accession XM_012215), a gene

which interacts with the lactase-phlorizin hydrolase promoter. Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC11. The function of HOXC11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2047.Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315) is another VGAM2684 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:7001, SEQ ID:29105 and SEQ ID:29112 respectively, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90223] Another function of VGAM2684 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315), a gene which is important for cytokine pro-

duction; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.MGC14289 (Accession NM_080660) is another VGAM2684 host target gene. MGC14289 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14289 BINDING SITE, designated SEQ ID:27946, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90224] Another function of VGAM2684 is therefore inhibition of MGC14289 (Accession NM_080660). Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14289. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM_044702) is another VGAM2684

host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:34261, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90225] Another function of VGAM2684 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM_044702). Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10. Ubiquitin Specific Protease 10 (USP10, Accession XM_033922) is another VGAM2684 host target gene. USP10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP10 BINDING SITE, designated SEQ ID:31983, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA,

also designated SEQ ID:5395.

[90226] Another function of VGAM2684 is therefore inhibition of Ubiquitin Specific Protease 10 (USP10, Accession XM_033922). Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP10. LOC145368 (Accession XM_085112) is another VGAM2684 host target gene. LOC145368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145368 BINDING SITE, designated SEQ ID:37827, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90227] Another function of VGAM2684 is therefore inhibition of LOC145368 (Accession XM_085112). Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145368. LOC150423 (Accession XM_086912) is another VGAM2684 host target gene. LOC150423 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC150423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150423 BINDING SITE, designated SEQ ID:38967, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90228] Another function of VGAM2684 is therefore inhibition of LOC150423 (Accession XM_086912). Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150423. LOC152343 (Accession XM_087441) is another VGAM2684 host target gene. LOC152343 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152343 BINDING SITE, designated SEQ ID:39261, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90229] Another function of VGAM2684 is therefore inhibition of LOC152343 (Accession XM_087441). Accordingly, utilities

of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152343. LOC197358 (Accession XM_113872) is another VGAM2684 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42506, to the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, also designated SEQ ID:5395.

[90230] Another function of VGAM2684 is therefore inhibition of LOC197358 (Accession XM_113872). Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2685 (VGAM2685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90231] VGAM2685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2685 was detected is described hereinabove with reference to Figs. 1-8.

[90232] VGAM2685 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 5-Ld. VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90233] VGAM2685 gene encodes a VGAM2685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2685 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2685 precursor RNA is designated SEQ ID:2671, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2671 is located at position 1580 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 5-Ld.

[90234] VGAM2685 precursor RNA folds onto itself, forming VGAM2685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90235] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2685 folded precursor RNA into VGAM2685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2685 RNA is designated SEQ ID:5396, and is provided hereinbelow with reference to the sequence listing part.

[90236] VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2685 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[90237] VGAM2685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2685 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2685 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90238] The complementary binding of VGAM2685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2685 host target RNA into VGAM2685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90239] It is appreciated that VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2685 host target genes. The mRNA of each one of this plurality of VGAM2685 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2685 RNA, herein designated VGAM RNA, and which when bound by VGAM2685 RNA causes inhibition of translation of respective one or more VGAM2685 host target proteins.

[90240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2685 gene, herein designated VGAM GENE, on one or more VGAM2685 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90241] It is yet further appreciated that a function of VGAM2685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2685 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 5-Ld. Specific functions, and accordingly utilities, of VGAM2685 correlate with, and may be deduced from, the identity of the host target genes which VGAM2685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90242] Nucleotide sequences of the VGAM2685 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2685 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2685 are further described hereinbelow with reference to Table 1.

[90243] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2685 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2685 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90244] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2685 gene, herein designated VGAM is inhibition of expression of VGAM2685 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2685 correlate with, and may be deduced from, the identity of the target genes which VGAM2685 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90245] Melanoma Antigen, Family B, 4 (MAGEB4, Accession NM_002367) is a VGAM2685 host target gene. MAGEB4

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAGEB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEB4 BINDING SITE, designated SEQ ID:8176, to the nucleotide sequence of VGAM2685 RNA, herein designated VGAM RNA, also designated SEQ ID:5396.

[90246] A function of VGAM2685 is therefore inhibition of Melanoma Antigen, Family B, 4 (MAGEB4, Accession NM_002367). Accordingly, utilities of VGAM2685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEB4. Claudin 1 (CLDN1, Accession NM_021101) is another VGAM2685 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22083, to the nucleotide sequence of VGAM2685 RNA, herein designated VGAM RNA, also designated SEQ

ID:5396.

[90247] Another function of VGAM2685 is therefore inhibition of Claudin 1 (CLDN1, Accession NM_021101). Accordingly, utilities of VGAM2685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. RNA Binding Motif Protein 7 (RBM7, Accession NM_016090) is another VGAM2685 host target gene. RBM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM7 BINDING SITE, designated SEQ ID:18178, to the nucleotide sequence of VGAM2685 RNA, herein designated VGAM RNA, also designated SEQ ID:5396.

[90248] Another function of VGAM2685 is therefore inhibition of RNA Binding Motif Protein 7 (RBM7, Accession NM_016090). Accordingly, utilities of VGAM2685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM7. LOC92497 (Accession XM_045436) is another VGAM2685 host target gene. LOC92497 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by LOC92497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92497 BINDING SITE, designated SEQ ID:34460, to the nucleotide sequence of VGAM2685 RNA, herein designated VGAM RNA, also designated SEQ ID:5396.

[90249] Another function of VGAM2685 is therefore inhibition of LOC92497 (Accession XM_045436). Accordingly, utilities of VGAM2685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92497. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2686 (VGAM2686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90250] VGAM2686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2686 was detected is described hereinabove with reference to Figs. 1-8.

[90251] VGAM2686 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ophiostoma Novo-ulmi Mitovirus 5-Ld. VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90252] VGAM2686 gene encodes a VGAM2686 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2686 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2686 precursor RNA is designated SEQ ID:2672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2672 is located at position 328 relative to the genome of Ophiostoma Novo-ulmi Mitovirus 5-Ld.

[90253] VGAM2686 precursor RNA folds onto itself, forming VGAM2686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90254] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2686 folded precursor RNA into VGAM2686 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2686 RNA is designated SEQ ID:5397, and is provided hereinbelow with reference to the sequence listing part.

[90255] VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2686 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90256] VGAM2686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2686 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90257] The complementary binding of VGAM2686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2686

host target RNA into VGAM2686 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90258] It is appreciated that VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2686 host target genes. The mRNA of each one of this plurality of VGAM2686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2686 RNA, herein designated VGAM RNA, and which when bound by VGAM2686 RNA causes inhibition of translation of respective one or more VGAM2686 host target proteins.

[90259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2686 gene, herein designated VGAM GENE, on one or more VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90260] It is yet further appreciated that a function of VGAM2686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2686 include diagnosis, prevention and treatment of viral infection by Ophiostoma Novo-ulmi Mitovirus 5-Ld. Specific functions, and accordingly utilities, of VGAM2686 correlate with, and may be deduced from, the identity of the host target genes which VGAM2686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90261] Nucleotide sequences of the VGAM2686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2686 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2686 are further

described hereinbelow with reference to Table 1.

[90262] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2686 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90263] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2686 gene, herein designated VGAM is inhibition of expression of VGAM2686 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2686 correlate with, and may be deduced from, the identity of the target genes which VGAM2686 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90264] Calnexin (CANX, Accession XM_113469) is a VGAM2686 host target gene. CANX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CANX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CANX BINDING SITE, desig-

nated SEQ ID:42277, to the nucleotide sequence of VGAM2686 RNA, herein designated VGAM RNA, also designated SEQ ID:5397.

[90265] A function of VGAM2686 is therefore inhibition of Calnexin (CANX, Accession XM_113469), a gene which may function as a chaperone in the endoplasmic reticulum, involved in the secretion of proteins from the ER to the outer cellular membrane. Accordingly, utilities of VGAM2686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CANX. The function of CANX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM116.Nuclear Receptor Coactivator 6 Interacting Protein (NCOA6IP, Accession NM_024831) is another VGAM2686 host target gene. NCOA6IP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA6IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6IP BINDING SITE, designated SEQ ID:24227, to the nucleotide sequence of VGAM2686 RNA, herein designated VGAM

RNA, also designated SEQ ID:5397.

[90266] Another function of VGAM2686 is therefore inhibition of Nuclear Receptor Coactivator 6 Interacting Protein (NCOA6IP, Accession NM_024831). Accordingly, utilities of VGAM2686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6IP. EPLIN (Accession NM_016357) is another VGAM2686 host target gene. EPLIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPLIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPLIN BINDING SITE, designated SEQ ID:18497, to the nucleotide sequence of VGAM2686 RNA, herein designated VGAM RNA, also designated SEQ ID:5397.

[90267] Another function of VGAM2686 is therefore inhibition of EPLIN (Accession NM_016357). Accordingly, utilities of VGAM2686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPLIN. LOC253970 (Accession XM_172910) is another VGAM2686 host target gene. LOC253970 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC253970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253970 BINDING SITE, designated SEQ ID:46172, to the nucleotide sequence of VGAM2686 RNA, herein designated VGAM RNA, also designated SEQ ID:5397.

[90268] Another function of VGAM2686 is therefore inhibition of LOC253970 (Accession XM_172910). Accordingly, utilities of VGAM2686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253970. LOC57826 (Accession NM_021183) is another VGAM2686 host target gene. LOC57826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57826 BINDING SITE, designated SEQ ID:22162, to the nucleotide sequence of VGAM2686 RNA, herein designated VGAM RNA, also designated SEQ ID:5397.

[90269] Another function of VGAM2686 is therefore inhibition of LOC57826 (Accession NM_021183). Accordingly, utilities

of VGAM2686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2687 (VGAM2687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90270] VGAM2687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2687 was detected is described hereinabove with reference to Figs. 1-8.

[90271] VGAM2687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Southern Bean Mosaic Virus. VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90272] VGAM2687 gene encodes a VGAM2687 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2687 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2687 precursor RNA is designated SEQ ID:2673, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2673 is located at position 820 relative to the genome of Southern Bean Mosaic Virus.

[90273] VGAM2687 precursor RNA folds onto itself, forming VGAM2687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90274] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2687 folded precursor RNA into VGAM2687 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2687 RNA is designated SEQ ID:5398, and

is provided hereinbelow with reference to the sequence listing part.

[90275] VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2687 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90276] VGAM2687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2687 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90277] The complementary binding of VGAM2687 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2687 host target RNA into VGAM2687 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90278] It is appreciated that VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2687 host target genes. The mRNA of each one of this plurality of VGAM2687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2687 RNA, herein designated VGAM RNA, and which when bound by VGAM2687 RNA causes inhibition of translation of respective one or more VGAM2687 host target proteins.

[90279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2687 gene, herein designated VGAM GENE, on one or more VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90280] It is yet further appreciated that a function of VGAM2687 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of viral infection by Southern Bean Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2687 correlate with, and may be deduced from, the identity of the host target genes which VGAM2687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90281] Nucleotide sequences of the VGAM2687 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2687 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2687 are further described hereinbelow with reference to Table 1.

[90282] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2687 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2687 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90283] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2687 gene, herein designated VGAM is inhibition of expression of VGAM2687 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2687 correlate with, and may be deduced from, the identity of the target genes which VGAM2687 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90284] Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is a VGAM2687 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:22924, to the nucleotide sequence of VGAM2687 RNA, herein designated VGAM RNA, also designated SEQ ID:5398.

[90285] A function of VGAM2687 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. FLJ10895

(Accession NM_019084) is another VGAM2687 host target gene. FLJ10895 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10895 BINDING SITE, designated SEQ ID:21157, to the nucleotide sequence of VGAM2687 RNA, herein designated VGAM RNA, also designated SEQ ID:5398.

[90286] Another function of VGAM2687 is therefore inhibition of FLJ10895 (Accession NM_019084). Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10895. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443) is another VGAM2687 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:28521, to the nucleotide se-

quence of VGAM2687 RNA, herein designated VGAM RNA, also designated SEQ ID:5398.

[90287] Another function of VGAM2687 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443). Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. KIAA1676 (Accession XM_167612) is another VGAM2687 host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1676 BINDING SITE, designated SEQ ID:44728, to the nucleotide sequence of VGAM2687 RNA, herein designated VGAM RNA, also designated SEQ ID:5398.

[90288] Another function of VGAM2687 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1676. LOC200609 (Accession XM_117256) is another VGAM2687 host target gene. LOC200609 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43332, to the nucleotide sequence of VGAM2687 RNA, herein designated VGAM RNA, also designated SEQ ID:5398.

[90289] Another function of VGAM2687 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2688 (VGAM2688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90290] VGAM2688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2688 was detected is described hereinabove with reference to Figs. 1-8.

[90291] VGAM2688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Southern Bean Mosaic Virus. VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90292] VGAM2688 gene encodes a VGAM2688 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2688 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2688 precursor RNA is designated SEQ ID:2674, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2674 is located at position 2629 relative to the genome of Southern Bean Mosaic Virus.

[90293] VGAM2688 precursor RNA folds onto itself, forming VGAM2688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[90294] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2688 folded precursor RNA into VGAM2688 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2688 RNA is designated SEQ ID:5399, and is provided hereinbelow with reference to the sequence listing part.

[90295] VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2688 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90296] VGAM2688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2688 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2688 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2688 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90297] The complementary binding of VGAM2688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2688 host target RNA into VGAM2688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90298] It is appreciated that VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2688 host target genes. The mRNA of each one of this plurality of VGAM2688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2688 RNA, herein designated VGAM RNA, and which when bound by VGAM2688 RNA causes inhibition of translation of respective one or more VGAM2688 host target proteins.

[90299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2688 gene, herein designated VGAM GENE, on one or more VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90300] It is yet further appreciated that a function of VGAM2688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of viral infection by Southern Bean Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2688 correlate with, and may be deduced from, the identity of the host target genes which VGAM2688 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90301] Nucleotide sequences of the VGAM2688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2688 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2688 are further described hereinbelow with reference to Table 1.

[90302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2688 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90303] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2688 gene, herein designated VGAM is inhibition of expression of VGAM2688 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2688 correlate with, and may be deduced from, the identity of the target genes which VGAM2688 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90304] Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950) is a VGAM2688 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10080, to the nucleotide sequence of VGAM2688 RNA, herein designated VGAM RNA, also designated SEQ ID:5399.

[90305] A function of VGAM2688 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.FLJ10520 (Accession NM_018124) is another VGAM2688 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:19903, to the nucleotide

sequence of VGAM2688 RNA, herein designated VGAM RNA, also designated SEQ ID:5399.

[90306] Another function of VGAM2688 is therefore inhibition of FLJ10520 (Accession NM_018124). Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520. KIAA0451 (Accession NM_014826) is another VGAM2688 host target gene. KIAA0451 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE, designated SEQ ID:16808, to the nucleotide sequence of VGAM2688 RNA, herein designated VGAM RNA, also designated SEQ ID:5399.

[90307] Another function of VGAM2688 is therefore inhibition of KIAA0451 (Accession NM_014826). Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451. Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM_004768) is another VGAM2688 host target gene. SFRS11 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by SFRS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS11 BINDING SITE, designated SEQ ID:11157, to the nucleotide sequence of VGAM2688 RNA, herein designated VGAM RNA, also designated SEQ ID:5399.

[90308] Another function of VGAM2688 is therefore inhibition of Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM_004768). Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS11. LOC149271 (Accession XM_086475) is another VGAM2688 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38675, to the nucleotide sequence of VGAM2688 RNA, herein designated VGAM RNA, also designated SEQ ID:5399.

[90309] Another function of VGAM2688 is therefore inhibition of LOC149271 (Accession XM_086475). Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC255196 (Accession XM_173157) is another VGAM2688 host target gene. LOC255196 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:46411, to the nucleotide sequence of VGAM2688 RNA, herein designated VGAM RNA, also designated SEQ ID:5399.

[90310] Another function of VGAM2688 is therefore inhibition of LOC255196 (Accession XM_173157). Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2689 (VGAM2689) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[90311] VGAM2689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2689 was detected is described hereinabove with reference to Figs. 1-8.

[90312] VGAM2689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Southern Bean Mosaic Virus. VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90313] VGAM2689 gene encodes a VGAM2689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2689 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2689 precursor RNA is designated SEQ ID:2675, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2675 is located at position 649 relative to the genome of Southern Bean Mosaic Virus.

[90314] VGAM2689 precursor RNA folds onto itself, forming VGAM2689 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90315] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2689 folded precursor RNA into VGAM2689 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2689 RNA is designated SEQ ID:5400, and is provided hereinbelow with reference to the sequence listing part.

[90316] VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2689 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90317] VGAM2689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2689 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2689 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90318] The complementary binding of VGAM2689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2689 host target RNA into VGAM2689 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90319] It is appreciated that VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2689 host target genes. The mRNA of each one of this plurality of VGAM2689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2689 RNA, herein designated VGAM RNA, and which when bound by VGAM2689 RNA causes inhibition of translation of respective one or more VGAM2689 host target proteins.

[90320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2689 gene, herein designated VGAM GENE, on one or more VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90321] It is yet further appreciated that a function of VGAM2689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of viral infection by Southern Bean Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2689 correlate with, and may be deduced from, the identity of the host target genes which VGAM2689 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[90322] Nucleotide sequences of the VGAM2689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2689 are further described hereinbelow with reference to Table 1.

[90323] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2689 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90324] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2689 gene, herein designated VGAM is inhibition of expression of VGAM2689 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2689 correlate with, and may be deduced from, the identity of the target genes which VGAM2689 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90325] E1A Binding Protein P300 (EP300, Accession NM_001429) is a VGAM2689 host target gene. EP300 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EP300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EP300 BINDING SITE, designated SEQ ID:7148, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90326] A function of VGAM2689 is therefore inhibition of E1A Binding Protein P300 (EP300, Accession NM_001429), a gene which may have a function in cell cycle regulation. Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EP300. The function of EP300 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Heme Oxygenase (decycling) 1 (HMOX1, Accession NM_002133) is another VGAM2689 host target gene. HMOX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMOX1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMOX1 BINDING SITE, designated SEQ ID:7910, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90327] Another function of VGAM2689 is therefore inhibition of Heme Oxygenase (decycling) 1 (HMOX1, Accession NM_002133). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMOX1. Retinoid X Receptor, Alpha (RXRA, Accession NM_002957) is another VGAM2689 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8867, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90328] Another function of VGAM2689 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM_002957),

a gene which activates genes required for vitamin A metabolism, binds 9-cis retinoic acid. Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA. The function of RXRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349.Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM_005118) is another VGAM2689 host target gene. TNFSF15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ ID:11601, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90329] Another function of VGAM2689 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM_005118), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of VGAM2689 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with TNFSF15. The function of TNFSF15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350.Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373) is another VGAM2689 host target gene. VAT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAT1 BINDING SITE, designated SEQ ID:13067, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90330] Another function of VGAM2689 is therefore inhibition of Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373), a gene which is a membrane protein of cholinergic synaptic vesicles. Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAT1. The function of VAT1 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM212.Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646) is another VGAM2689 host target gene. DGKZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKZ BINDING SITE, designated SEQ ID:9720, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90331] Another function of VGAM2689 is therefore inhibition of Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKZ. DKFZP434F0318 (Accession NM_030817) is another VGAM2689 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25140, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90332] Another function of VGAM2689 is therefore inhibition of DKFZP434F0318 (Accession NM_030817). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. FLJ20034 (Accession NM_017630) is another VGAM2689 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19131, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90333] Another function of VGAM2689 is therefore inhibition of FLJ20034 (Accession NM_017630). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. FLJ20188 (Accession NM_017703) is another

VGAM2689 host target gene. FLJ20188 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20188 BINDING SITE, designated SEQ ID:19276, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90334] Another function of VGAM2689 is therefore inhibition of FLJ20188 (Accession NM_017703). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20188. KIAA1317 (Accession XM_098368) is another VGAM2689 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41626, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90335] Another function of VGAM2689 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. KIAA1813 (Accession XM_046743) is another VGAM2689 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34811, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90336] Another function of VGAM2689 is therefore inhibition of KIAA1813 (Accession XM_046743). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1813. Keratin Associated Protein 1-5 (KRTAP1-5, Accession NM_031957) is another VGAM2689 host target gene. KRTAP1-5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KRTAP1-5, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTAP1-5 BINDING SITE, designated SEQ ID:25698, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90337] Another function of VGAM2689 is therefore inhibition of Keratin Associated Protein 1-5 (KRTAP1-5, Accession NM_031957). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP1-5. MAGE-E1 (Accession NM_030801) is another VGAM2689 host target gene. MAGE-E1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAGE-E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGE-E1 BINDING SITE, designated SEQ ID:25104, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90338] Another function of VGAM2689 is therefore inhibition of MAGE-E1 (Accession NM_030801). Accordingly, utilities of

VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGE-E1. moblak (Accession NM_130807) is another VGAM2689 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28306, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90339] Another function of VGAM2689 is therefore inhibition of moblak (Accession NM_130807). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM_044702) is another VGAM2689 host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:34262, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90340] Another function of VGAM2689 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM_044702). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10. TBC1 Domain Family, Member 2 (TBC1D2, Accession NM_018421) is another VGAM2689 host target gene. TBC1D2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TBC1D2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBC1D2 BINDING SITE, designated SEQ ID:20465, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90341] Another function of VGAM2689 is therefore inhibition of TBC1 Domain Family, Member 2 (TBC1D2, Accession NM_018421). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TBC1D2. Tyrosine Kinase, Non-receptor, 1 (TNK1, Accession NM_003985) is another VGAM2689 host target gene. TNK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNK1 BINDING SITE, designated SEQ ID:10135, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90342] Another function of VGAM2689 is therefore inhibition of Tyrosine Kinase, Non-receptor, 1 (TNK1, Accession NM_003985). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNK1. LOC146774 (Accession XM_085584) is another VGAM2689 host target gene. LOC146774 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146774 BINDING SITE, desig-

nated SEQ ID:38235, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90343] Another function of VGAM2689 is therefore inhibition of LOC146774 (Accession XM_085584). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146774. LOC150290 (Accession XM_086863) is another VGAM2689 host target gene. LOC150290 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150290 BINDING SITE, designated SEQ ID:38931, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90344] Another function of VGAM2689 is therefore inhibition of LOC150290 (Accession XM_086863). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150290. LOC155064 (Accession XM_088128) is another VGAM2689 host target gene. LOC155064 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC155064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155064 BINDING SITE, designated SEQ ID:39528, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90345] Another function of VGAM2689 is therefore inhibition of LOC155064 (Accession XM_088128). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155064. LOC256477 (Accession XM_173324) is another VGAM2689 host target gene. LOC256477 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256477 BINDING SITE, designated SEQ ID:46535, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90346] Another function of VGAM2689 is therefore inhibition of

LOC256477 (Accession XM_173324). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256477. LOC257465 (Accession XM_088384) is another VGAM2689 host target gene. LOC257465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257465 BINDING SITE, designated SEQ ID:39666, to the nucleotide sequence of VGAM2689 RNA, herein designated VGAM RNA, also designated SEQ ID:5400.

[90347] Another function of VGAM2689 is therefore inhibition of LOC257465 (Accession XM_088384). Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2690 (VGAM2690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[90348] VGAM2690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2690 was detected is described hereinabove with reference to Figs. 1-8.

[90349] VGAM2690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phthorimaea Operculella Granulovirus. VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90350] VGAM2690 gene encodes a VGAM2690 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2690 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2690 precursor RNA is designated SEQ ID:2676, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2676 is located at position 69388 relative to the genome of Phthorimaea Operculella Granulovirus.

[90351] VGAM2690 precursor RNA folds onto itself, forming VGAM2690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90352] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2690 folded precursor RNA into VGAM2690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2690 RNA is designated SEQ ID:5401, and is provided hereinbelow with reference to the sequence listing part.

[90353] VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2690 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90354] VGAM2690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2690 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[90355] The complementary binding of VGAM2690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2690 host target RNA into VGAM2690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90356] It is appreciated that VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2690 host target genes. The mRNA of each one of this plurality of VGAM2690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2690 RNA, herein designated VGAM RNA, and which when bound by VGAM2690 RNA causes inhibition of translation of respective one or more VGAM2690 host target proteins.

[90357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2690 gene, herein designated VGAM GENE, on one

or more VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90358] It is yet further appreciated that a function of VGAM2690 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2690 include diagnosis, prevention and treatment of viral infection by Phthorimaea Operculella Granulovirus. Specific functions, and accordingly utilities, of VGAM2690 correlate with, and may be deduced from, the identity of the host target genes which VGAM2690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90359] Nucleotide sequences of the VGAM2690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2690 are further described hereinbelow with reference to Table 1.

[90360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2690 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90361] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2690 gene, herein designated VGAM is inhibition of expression of VGAM2690 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2690 correlate with, and may be deduced from, the identity of the target genes which VGAM2690 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90362] COX11 Homolog, Cytochrome C Oxidase Assembly Protein

(yeast) (COX11, Accession NM_004375) is a VGAM2690 host target gene. COX11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX11 BINDING SITE, designated SEQ ID:10596, to the nucleotide sequence of VGAM2690 RNA, herein designated VGAM RNA, also designated SEQ ID:5401.

[90363] A function of VGAM2690 is therefore inhibition of COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM_004375). Accordingly, utilities of VGAM2690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX11. CEGP1 (Accession NM_020974) is another VGAM2690 host target gene. CEGP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CEGP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEGP1 BINDING SITE, designated SEQ ID:21958, to the nucleotide sequence of VGAM2690 RNA,

herein designated VGAM RNA, also designated SEQ ID:5401.

[90364] Another function of VGAM2690 is therefore inhibition of CEGP1 (Accession NM_020974). Accordingly, utilities of VGAM2690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEGP1. KIAA1061 (Accession XM_048786) is another VGAM2690 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35264, to the nucleotide sequence of VGAM2690 RNA, herein designated VGAM RNA, also designated SEQ ID:5401.

[90365] Another function of VGAM2690 is therefore inhibition of KIAA1061 (Accession XM_048786). Accordingly, utilities of VGAM2690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061. KIAA1211 (Accession XM_044178) is another VGAM2690 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34159, to the nucleotide sequence of VGAM2690 RNA, herein designated VGAM RNA, also designated SEQ ID:5401.

[90366] Another function of VGAM2690 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM2690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. LOC163231 (Accession XM_092094) is another VGAM2690 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40093, to the nucleotide sequence of VGAM2690 RNA, herein designated VGAM RNA, also designated SEQ ID:5401.

[90367] Another function of VGAM2690 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities

of VGAM2690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2691 (VGAM2691) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90368] VGAM2691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2691 was detected is described hereinabove with reference to Figs. 1-8.

[90369] VGAM2691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phthorimaea Operculella Granulovirus. VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90370] VGAM2691 gene encodes a VGAM2691 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2691 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2691 precursor RNA is designated SEQ ID:2677, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2677 is located at position 68718 relative to the genome of Phthorimaea Operculella Granulovirus.

[90371] VGAM2691 precursor RNA folds onto itself, forming VGAM2691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90372] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2691 folded precursor RNA into VGAM2691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2691 RNA is designated SEQ ID:5402, and

is provided hereinbelow with reference to the sequence listing part.

[90373] VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2691 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90374] VGAM2691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2691 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2691 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90375] The complementary binding of VGAM2691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2691 host target RNA into VGAM2691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90376] It is appreciated that VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2691 host target genes. The mRNA of each one of this plurality of VGAM2691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2691 RNA, herein designated VGAM RNA, and which when bound by VGAM2691 RNA causes inhibition of translation of respective one or more VGAM2691 host target proteins.

[90377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2691 gene, herein designated VGAM GENE, on one or more VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90378] It is yet further appreciated that a function of VGAM2691 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2691 include diagnosis, prevention and treatment of viral infection by Phthorimaea Operculella Granulovirus. Specific functions, and accordingly utilities, of VGAM2691 correlate with, and may be deduced from, the identity of the host target genes which VGAM2691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90379] Nucleotide sequences of the VGAM2691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2691 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2691 are further described hereinbelow with reference to Table 1.

[90380] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2691 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2691 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90381] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2691 gene, herein designated VGAM is inhibition of expression of VGAM2691 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2691 correlate with, and may be deduced from, the identity of the target genes which VGAM2691 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90382] Reserved (C8orf13, Accession XM_088377) is a VGAM2691 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39651, to the nucleotide sequence of VGAM2691 RNA, herein designated VGAM RNA, also designated SEQ ID:5402.

[90383] A function of VGAM2691 is therefore inhibition of Reserved (C8orf13, Accession XM_088377). Accordingly, utilities of VGAM2691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. PP35 (Accession NM_007016) is another VGAM2691 host target gene. PP35 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by PP35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP35 BINDING SITE, designated SEQ ID:13871, to the nucleotide sequence of VGAM2691 RNA, herein designated VGAM RNA, also designated SEQ ID:5402.

[90384] Another function of VGAM2691 is therefore inhibition of PP35 (Accession NM_007016). Accordingly, utilities of VGAM2691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP35. LOC200014 (Accession XM_114087) is another VGAM2691 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42686, to the nucleotide sequence of VGAM2691 RNA, herein designated VGAM RNA, also designated SEQ ID:5402.

[90385] Another function of VGAM2691 is therefore inhibition of

LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM2691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2692 (VGAM2692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90386] VGAM2692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2692 was detected is described hereinabove with reference to Figs. 1-8.

[90387] VGAM2692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phthorimaea Operculella Granulovirus. VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90388] VGAM2692 gene encodes a VGAM2692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2692 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2692 precursor RNA is designated SEQ ID:2678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2678 is located at position 70677 relative to the genome of Phthorimaea Operculella Granulovirus.

[90389] VGAM2692 precursor RNA folds onto itself, forming VGAM2692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90390] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2692 folded precursor RNA into VGAM2692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM2692 RNA is designated SEQ ID:5403, and is provided hereinbelow with reference to the sequence listing part.

[90391] VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2692 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90392] VGAM2692 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2692 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90393] The complementary binding of VGAM2692 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2692 host target RNA into VGAM2692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90394] It is appreciated that VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2692 host target genes. The mRNA of each one of this plurality of VGAM2692 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2692 RNA, herein designated VGAM RNA, and which when bound by VGAM2692 RNA causes inhibition of translation of respective one or more VGAM2692 host target proteins.

[90395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2692 gene, herein designated VGAM GENE, on one or more VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90396] It is yet further appreciated that a function of VGAM2692

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of viral infection by Phthorimaea Operculella Granulovirus. Specific functions, and accordingly utilities, of VGAM2692 correlate with, and may be deduced from, the identity of the host target genes which VGAM2692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90397] Nucleotide sequences of the VGAM2692 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2692 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2692 are further described hereinbelow with reference to Table 1.

[90398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2692 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2692 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90399] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2692 gene, herein designated VGAM is inhibition of expression of VGAM2692 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2692 correlate with, and may be deduced from, the identity of the target genes which VGAM2692 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90400] F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300) is a VGAM2692 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:14667, SEQ ID:27369 and SEQ ID:27379 respectively, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90401] A function of VGAM2692 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300), a gene which somehow is involved in the

process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM_042965) is another VGAM2692 host target gene. C1orf17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf17 BINDING SITE, designated SEQ ID:33856, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90402] Another function of VGAM2692 is therefore inhibition of Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM_042965). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf17. DK-

FZp434A2417 (Accession XM_038526) is another VGAM2692 host target gene. DKFZp434A2417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32866, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90403] Another function of VGAM2692 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. FLJ10607 (Accession XM_085119) is another VGAM2692 host target gene. FLJ10607 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10607 BINDING SITE, designated SEQ ID:37836, to the

nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90404] Another function of VGAM2692 is therefore inhibition of FLJ10607 (Accession XM_085119). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10607. FLJ20202 (Accession NM_017709) is another VGAM2692 host target gene. FLJ20202 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20202 BINDING SITE, designated SEQ ID:19290, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90405] Another function of VGAM2692 is therefore inhibition of FLJ20202 (Accession NM_017709). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20202. FLJ31101 (Accession NM_017964) is another VGAM2692 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19688, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90406] Another function of VGAM2692 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. KIAA0979 (Accession NM_015032) is another VGAM2692 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:17390, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90407] Another function of VGAM2692 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities

of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. Neuron Navigator 3 (NAV3, Accession NM_014903) is another VGAM2692 host target gene. NAV3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV3 BINDING SITE, designated SEQ ID:17092, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90408] Another function of VGAM2692 is therefore inhibition of Neuron Navigator 3 (NAV3, Accession NM_014903). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV3. p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653) is another VGAM2692 host target gene. PAK7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PAK7 BINDING SITE, designated SEQ ID:34512, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90409] Another function of VGAM2692 is therefore inhibition of p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7. SEC14-like 1 (S. cerevisiae) (SEC14L1, Accession NM_003003) is another VGAM2692 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:8907, to the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, also designated SEQ ID:5403.

[90410] Another function of VGAM2692 is therefore inhibition of SEC14-like 1 (S. cerevisiae) (SEC14L1, Accession NM_003003). Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SEC14L1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2693 (VGAM2693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90411] VGAM2693 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2693 was detected is described hereinabove with reference to Figs. 1-8.

[90412] VGAM2693 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phthorimaea Operculella Granulovirus. VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90413] VGAM2693 gene encodes a VGAM2693 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2693 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2693 precursor RNA is designated SEQ ID:2679, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2679 is located at position 70243 relative to the genome of Phthorimaea Operculella Granulovirus.

[90414] VGAM2693 precursor RNA folds onto itself, forming VGAM2693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90415] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2693 folded precursor RNA into VGAM2693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2693 RNA is designated SEQ ID:5404, and is provided hereinbelow with reference to the sequence listing part.

[90416] VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2693 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90417] VGAM2693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2693 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90418] The complementary binding of VGAM2693 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2693 host target RNA into VGAM2693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90419] It is appreciated that VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2693 host target genes. The mRNA of each one of this plurality of VGAM2693 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2693 RNA, herein designated VGAM RNA, and which when bound by VGAM2693 RNA causes

inhibition of translation of respective one or more VGAM2693 host target proteins.

[90420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2693 gene, herein designated VGAM GENE, on one or more VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90421] It is yet further appreciated that a function of VGAM2693 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2693 include diagnosis, prevention and

treatment of viral infection by Phthorimaea Operculella Granulovirus. Specific functions, and accordingly utilities, of VGAM2693 correlate with, and may be deduced from, the identity of the host target genes which VGAM2693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90422] Nucleotide sequences of the VGAM2693 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2693 are further described hereinbelow with reference to Table 1.

[90423] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2693 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2693 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90424] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2693 gene, herein designated VGAM is inhibition of expression of VGAM2693 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2693 correlate with, and may be deduced from, the identity of the target genes which VGAM2693 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90425] Archain 1 (ARCN1, Accession NM_001655) is a VGAM2693 host target gene. ARCN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:7365, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90426] A function of VGAM2693 is therefore inhibition of Archain 1 (ARCN1, Accession NM_001655), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1. The function of ARCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1226.UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783) is another VGAM2693 host target gene. B3GALT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by B3GALT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT2 BINDING SITE, designated SEQ ID:9869, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90427] Another function of VGAM2693 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT2. Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM_003633) is another VGAM2693 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:9695, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90428] Another function of VGAM2693 is therefore inhibition of Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM_003633), a gene which is an actin-binding protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233.Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM_004447) is another VGAM2693 host target gene. EPS8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPS8

BINDING SITE, designated SEQ ID:10741, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90429] Another function of VGAM2693 is therefore inhibition of Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM_004447), a gene which has a role in normal and neoplastic cell proliferation; contains an SH3 motif. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPS8. The function of EPS8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533.Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134) is another VGAM2693 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5621, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90430] Another function of VGAM2693 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951.Lipoprotein Lipase (LPL, Accession NM_000237) is another VGAM2693 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5748, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90431] Another function of VGAM2693 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the en-

zyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186) is another VGAM2693 host target gene. NR4A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NR4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A2 BINDING SITE, designated SEQ ID:12853, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90432] Another function of VGAM2693 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186), a gene which may be a general coactivator of transcription. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with NR4A2. The function of NR4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127.Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_004562) is another VGAM2693 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:10902, SEQ ID:15149 and SEQ ID:15156 respectively, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90433] Another function of VGAM2693 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_004562). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARK2. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Ac-

cession NM_021988) is another VGAM2693 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:22517, SEQ ID:9365 and SEQ ID:17886 respectively, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90434] Another function of VGAM2693 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_021988), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.KIAA0335 (Accession NM_014803) is another VGAM2693 host target gene. KIAA0335 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16728, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90435] Another function of VGAM2693 is therefore inhibition of KIAA0335 (Accession NM_014803). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138966) is another VGAM2693 host target gene. NETO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NETO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO1 BINDING SITE, designated SEQ ID:29068, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90436] Another function of VGAM2693 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138966). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO1. NTT73 (Accession NM_018057) is another VGAM2693 host target gene. NTT73 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTT73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTT73 BINDING SITE, designated SEQ ID:19821, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90437] Another function of VGAM2693 is therefore inhibition of NTT73 (Accession NM_018057). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTT73. R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361) is another VGAM2693 host target gene. R3HDM BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by R3HDM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R3HDM BINDING SITE, designated SEQ ID:17658, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90438] Another function of VGAM2693 is therefore inhibition of R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with R3HDM. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM2693 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32557, to the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, also designated SEQ ID:5404.

[90439] Another function of VGAM2693 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2694 (VGAM2694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90440] VGAM2694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2694 was detected is described hereinabove with reference to Figs. 1-8.

[90441] VGAM2694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phthorimaea Operculella Granulovirus. VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90442] VGAM2694 gene encodes a VGAM2694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2694 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2694 precursor RNA is designated SEQ ID:2680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2680 is located at position 71428 relative to the genome of Phthorimaea Operculella Granulovirus.

[90443] VGAM2694 precursor RNA folds onto itself, forming VGAM2694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90444] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2694 folded precursor RNA into VGAM2694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2694 RNA is designated SEQ ID:5405, and is provided hereinbelow with reference to the sequence listing part.

[90445] VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2694 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90446] VGAM2694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2694 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2694 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90447] The complementary binding of VGAM2694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2694 host target RNA into VGAM2694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90448] It is appreciated that VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2694 host target genes. The mRNA of

each one of this plurality of VGAM2694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2694 RNA, herein designated VGAM RNA, and which when bound by VGAM2694 RNA causes inhibition of translation of respective one or more VGAM2694 host target proteins.

[90449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2694 gene, herein designated VGAM GENE, on one or more VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[90450] It is yet further appreciated that a function of VGAM2694 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of viral infection by Phthorimaea Operculella Granulovirus. Specific functions, and accordingly utilities, of VGAM2694 correlate with, and may be deduced from, the identity of the host target genes which VGAM2694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90451] Nucleotide sequences of the VGAM2694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2694 are further described hereinbelow with reference to Table 1.

[90452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2694 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2694 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90453] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2694 gene, herein designated VGAM is inhibition of expression of VGAM2694 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2694 correlate with, and may be deduced from, the identity of the target genes which VGAM2694 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90454] ADP-ribosylation Factor-like 4 (ARL4, Accession NM_005738) is a VGAM2694 host target gene. ARL4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL4 BINDING SITE, designated SEQ ID:12299, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90455] A function of VGAM2694 is therefore inhibition of ADP-ribosylation Factor-like 4 (ARL4, Accession NM_005738), a gene which may be required for the progression of cells

through meiosis. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL4. The function of ARL4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1050.Moesin (MSN, Accession XM_013042) is another VGAM2694 host target gene. MSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSN BINDING SITE, designated SEQ ID:30227, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90456] Another function of VGAM2694 is therefore inhibition of Moesin (MSN, Accession XM_013042), a gene which may have a role linking the cytoskeleton to the plasma membrane. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSN. The function of MSN and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM248.Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is another VGAM2694 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15285, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90457] Another function of VGAM2694 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Norrie Disease (pseudoglioma) (NDP, Accession NM_000266) is

another VGAM2694 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5805, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90458] Another function of VGAM2694 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM_000266), a gene which may be involved in a pathway that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.Soc-2 Suppressor of Clear Homolog (C. elegans) (SHOC2, Accession NM_007373) is another VGAM2694 host target gene. SHOC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SHOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOC2 BINDING SITE, designated SEQ ID:14305, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90459] Another function of VGAM2694 is therefore inhibition of Soc-2 Suppressor of Clear Homolog (C. elegans) (SHOC2, Accession NM_007373), a gene which may be a regulator of the let-60 ras pathway. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOC2. The function of SHOC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464.Sarcospan (Kras oncogene-associated gene) (SSPN, Accession NM_005086) is another VGAM2694 host target gene. SSPN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SSPN BINDING SITE, designated SEQ ID:11536, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90460] Another function of VGAM2694 is therefore inhibition of Sarcospan (Kras oncogene-associated gene) (SSPN, Accession NM_005086), a gene which spans the muscle plasma membrane and forms a link between the f-actin cytoskeleton and the extracellular matrix. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSPN. The function of SSPN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM996.SUV39H2 (Accession NM_024670) is another VGAM2694 host target gene. SUV39H2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUV39H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H2 BINDING SITE, designated SEQ ID:23977, to the nucleotide sequence of VGAM2694 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5405.

[90461] Another function of VGAM2694 is therefore inhibition of SUV39H2 (Accession NM_024670), a gene which is involved in gene repression and the modification of position-effect- variegation. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H2. The function of SUV39H2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM424.Tripartite Motif-containing 37 (TRIM37, Accession NM_015294) is another VGAM2694 host target gene. TRIM37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM37 BINDING SITE, designated SEQ ID:17616, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90462] Another function of VGAM2694 is therefore inhibition of Tripartite Motif-containing 37 (TRIM37, Accession

NM_015294). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37. Zinc Finger Protein 137 (clone pHZ-30) (ZNF137, Accession NM_003438) is another VGAM2694 host target gene. ZNF137 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF137 BINDING SITE, designated SEQ ID:9495, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90463] Another function of VGAM2694 is therefore inhibition of Zinc Finger Protein 137 (clone pHZ-30) (ZNF137, Accession NM_003438). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF137. ATPase, Class V, Type 10D (ATP10D, Accession XM_054907) is another VGAM2694 host target gene. ATP10D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP10D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10D BINDING SITE, designated SEQ ID:36203, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90464] Another function of VGAM2694 is therefore inhibition of ATPase, Class V, Type 10D (ATP10D, Accession XM_054907). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10D. Chromosome 2 Open Reading Frame 6 (C2orf6, Accession NM_018221) is another VGAM2694 host target gene. C2orf6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C2orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C2orf6 BINDING SITE, designated SEQ ID:20143, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90465] Another function of VGAM2694 is therefore inhibition of Chromosome 2 Open Reading Frame 6 (C2orf6, Accession NM_018221). Accordingly, utilities of VGAM2694 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with C2orf6. ELL2 (Accession NM_012081) is another VGAM2694 host target gene. ELL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL2 BINDING SITE, designated SEQ ID:14370, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90466] Another function of VGAM2694 is therefore inhibition of ELL2 (Accession NM_012081). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL2. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625) is another VGAM2694 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ

ID:13412, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90467] Another function of VGAM2694 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. KIAA0495 (Accession XM_031397) is another VGAM2694 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31365, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90468] Another function of VGAM2694 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. NET-6 (Accession NM_014399) is another

VGAM2694 host target gene. NET-6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NET-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET-6 BINDING SITE, designated SEQ ID:15743, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90469] Another function of VGAM2694 is therefore inhibition of NET-6 (Accession NM_014399). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-6. LOC150517 (Accession XM_086936) is another VGAM2694 host target gene. LOC150517 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150517, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150517 BINDING SITE, designated SEQ ID:38986, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90470] Another function of VGAM2694 is therefore inhibition of LOC150517 (Accession XM_086936). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150517. LOC253228 (Accession XM_171113) is another VGAM2694 host target gene. LOC253228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253228 BINDING SITE, designated SEQ ID:45914, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90471] Another function of VGAM2694 is therefore inhibition of LOC253228 (Accession XM_171113). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253228. LOC256946 (Accession XM_170543) is another VGAM2694 host target gene. LOC256946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256946, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256946 BINDING SITE, designated SEQ ID:45362, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90472] Another function of VGAM2694 is therefore inhibition of LOC256946 (Accession XM_170543). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256946. LOC56959 (Accession XM_088578) is another VGAM2694 host target gene. LOC56959 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC56959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56959 BINDING SITE, designated SEQ ID:39838, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90473] Another function of VGAM2694 is therefore inhibition of LOC56959 (Accession XM_088578). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC56959. LOC93550 (Accession XM_051999) is another VGAM2694 host target gene. LOC93550 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93550 BINDING SITE, designated SEQ ID:35932, to the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, also designated SEQ ID:5405.

[90474] Another function of VGAM2694 is therefore inhibition of LOC93550 (Accession XM_051999). Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93550. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2695 (VGAM2695) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90475] VGAM2695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2695 was detected is described hereinabove with reference to Figs. 1-8.

[90476] VGAM2695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fringilla Coelebs Papillomavirus (FPV). VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90477] VGAM2695 gene encodes a VGAM2695 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2695 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2695 precursor RNA is designated SEQ ID:2681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2681 is located at position 1921 relative to the genome of Fringilla Coelebs Papillomavirus (FPV).

[90478] VGAM2695 precursor RNA folds onto itself, forming VGAM2695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90479] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2695 folded precursor RNA into VGAM2695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM2695 RNA is designated SEQ ID:5406, and is provided hereinbelow with reference to the sequence listing part.

[90480] VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2695 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90481] VGAM2695 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2695 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2695 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90482] The complementary binding of VGAM2695 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2695 host target RNA into VGAM2695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90483] It is appreciated that VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2695 host target genes. The mRNA of each one of this plurality of VGAM2695 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2695 RNA, herein designated VGAM RNA, and which when bound by VGAM2695 RNA causes inhibition of translation of respective one or more VGAM2695 host target proteins.

[90484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2695 gene, herein designated VGAM GENE, on one or more VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90485] It is yet further appreciated that a function of VGAM2695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2695 include diagnosis, prevention and treatment of viral infection by Fringilla Coelebs Papillomavirus (FPV). Specific functions, and accordingly utilities, of VGAM2695 correlate with, and may be deduced from, the identity of the host target genes which VGAM2695 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90486] Nucleotide sequences of the VGAM2695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2695 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2695 are further described hereinbelow with reference to Table 1.

[90487] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2695 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2695 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90488] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2695 gene, herein designated VGAM is inhibition of expression of VGAM2695 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2695 correlate with, and may be deduced from, the identity of the target genes which VGAM2695 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90489] V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433) is a VGAM2695 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:11912, to the nucleotide sequence of VGAM2695 RNA, herein designated VGAM RNA, also designated SEQ ID:5406.

[90490] A function of VGAM2695 is therefore inhibition of V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433), a gene which is a putative protein-tyrosine kinase. Accordingly, utilities of VGAM2695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.KIAA0721 (Accession NM_021648) is another VGAM2695 host target gene. KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0721, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE1 and KIAA0721

BINDING SITE2, designated SEQ ID:22317 and SEQ ID:45924 respectively, to the nucleotide sequence of VGAM2695 RNA, herein designated VGAM RNA, also designated SEQ ID:5406.

[90491] Another function of VGAM2695 is therefore inhibition of KIAA0721 (Accession NM_021648). Accordingly, utilities of VGAM2695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2696 (VGAM2696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90492] VGAM2696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2696 was detected is described hereinabove with reference to Figs. 1-8.

[90493] VGAM2696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paprika Mild Mottle Virus. VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[90494] VGAM2696 gene encodes a VGAM2696 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2696 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2696 precursor RNA is designated SEQ ID:2682, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2682 is located at position 4675 relative to the genome of Paprika Mild Mottle Virus.

[90495] VGAM2696 precursor RNA folds onto itself, forming VGAM2696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90496] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2696 folded precursor RNA into VGAM2696 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM2696 RNA is designated SEQ ID:5407, and is provided hereinbelow with reference to the sequence listing part.

[90497] VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2696 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90498] VGAM2696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2696 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90499] The complementary binding of VGAM2696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2696 host target RNA into VGAM2696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90500] It is appreciated that VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2696 host target genes. The mRNA of each one of this plurality of VGAM2696 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2696 RNA, herein designated VGAM RNA, and which when bound by VGAM2696 RNA causes inhibition of translation of respective one or more VGAM2696 host target proteins.

[90501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2696 gene, herein designated VGAM GENE, on one or more VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90502] It is yet further appreciated that a function of VGAM2696 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of viral infection by Paprika Mild Mottle Virus. Specific functions, and accordingly utilities, of VGAM2696 correlate with, and may be deduced from, the identity of the host target genes which VGAM2696 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90503] Nucleotide sequences of the VGAM2696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2696 are further described hereinbelow with reference to Table 1.

[90504] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2696 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90505] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2696 gene, herein designated VGAM is inhibition of expression of VGAM2696 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2696 correlate with, and may be deduced from, the identity of the target genes which VGAM2696 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90506] Inhibitor of Growth Family, Member 1 (ING1, Accession NM_005537) is a VGAM2696 host target gene. ING1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ING1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ING1 BINDING SITE, designated SEQ ID:12061, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90507] A function of VGAM2696 is therefore inhibition of Inhibitor of Growth Family, Member 1 (ING1, Accession NM_005537), a gene which acts as a potent growth regulator in normal and in established cells. Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ING1. The function of ING1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM170.Mitogen-activated Protein Kinase Kinase Kinase 9 (MAP3K9, Accession XM_027237) is another VGAM2696 host target gene. MAP3K9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K9 BINDING SITE, designated SEQ ID:30460, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90508] Another function of VGAM2696 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 9 (MAP3K9, Accession XM_027237), a gene which is a

MIXED-LINEAGE KINASE 1. Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K9. The function of MAP3K9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1601.Purinergic Receptor P2Y, G-protein Coupled, 1 (P2RY1, Accession NM_002563) is another VGAM2696 host target gene. P2RY1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY1 BINDING SITE, designated SEQ ID:8412, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90509] Another function of VGAM2696 is therefore inhibition of Purinergic Receptor P2Y, G-protein Coupled, 1 (P2RY1, Accession NM_002563), a gene which plays an essential role in thrombotic states. Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY1.

The function of P2RY1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 8 (SLC7A8, Accession NM_012244) is another VGAM2696 host target gene. SLC7A8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC7A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A8 BINDING SITE, designated SEQ ID:14551, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90510] Another function of VGAM2696 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 8 (SLC7A8, Accession NM_012244), a gene which helps mediate transport of large and small neutral amino acids. Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A8. The function of SLC7A8 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1263.Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152) is another VGAM2696 host target gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19960, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90511] Another function of VGAM2696 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152). Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf12. Collectin Sub-family Member 10 (C-type lectin) (COLEC10, Accession NM_006438) is another VGAM2696 host target gene. COLEC10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COLEC10, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLEC10 BINDING SITE, designated SEQ ID:13144, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90512] Another function of VGAM2696 is therefore inhibition of Collectin Sub-family Member 10 (C-type lectin) (COLEC10, Accession NM_006438). Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC10. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM2696 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16175, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90513] Another function of VGAM2696 is therefore inhibition of

Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC133584 (Accession XM_059661) is another VGAM2696 host target gene. LOC133584 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133584 BINDING SITE, designated SEQ ID:37044, to the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, also designated SEQ ID:5407.

[90514] Another function of VGAM2696 is therefore inhibition of LOC133584 (Accession XM_059661). Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133584. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2697 (VGAM2697) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[90515] VGAM2697 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2697 was detected is described hereinabove with reference to Figs. 1-8.

[90516] VGAM2697 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paprika Mild Mottle Virus. VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90517] VGAM2697 gene encodes a VGAM2697 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2697 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2697 precursor RNA is designated SEQ ID:2683, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2683 is located at position 891 relative to the genome of Paprika Mild Mottle Virus.

[90518] VGAM2697 precursor RNA folds onto itself, forming VGAM2697 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90519] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2697 folded precursor RNA into VGAM2697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2697 RNA is designated SEQ ID:5408, and is provided hereinbelow with reference to the sequence listing part.

[90520] VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2697 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90521] VGAM2697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2697 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2697 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90522] The complementary binding of VGAM2697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2697 host target RNA into VGAM2697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90523] It is appreciated that VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2697 host target genes. The mRNA of each one of this plurality of VGAM2697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2697 RNA, herein designated VGAM RNA, and which when bound by VGAM2697 RNA causes inhibition of translation of respective one or more VGAM2697 host target proteins.

[90524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2697 gene, herein designated VGAM GENE, on one or more VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90525] It is yet further appreciated that a function of VGAM2697 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of viral infection by Paprika Mild Mottle Virus. Specific functions, and accordingly utilities, of VGAM2697 correlate with, and may be deduced from, the identity of the host target genes which VGAM2697 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[90526] Nucleotide sequences of the VGAM2697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2697 are further described hereinbelow with reference to Table 1.

[90527] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2697 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90528] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2697 gene, herein designated VGAM is inhibition of expression of VGAM2697 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2697 correlate with, and may be deduced from, the identity of the target genes which VGAM2697 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90529] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM2697 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23171, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90530] A function of VGAM2697 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Integrin, Alpha V (vitronectin receptor, alpha polypeptide, antigen CD51) (ITGAV, Accession NM_002210) is another VGAM2697 host target gene. ITGAV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ITGAV BINDING SITE, designated SEQ ID:7975, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90531] Another function of VGAM2697 is therefore inhibition of Integrin, Alpha V (vitronectin receptor, alpha polypeptide, antigen CD51) (ITGAV, Accession NM_002210), a gene which is a member of the integrin family of cell-surface proteins. Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAV. The function of ITGAV and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM20.Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184) is another VGAM2697 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31298, to the nucleotide sequence of VGAM2697 RNA,

herein designated VGAM RNA, also designated SEQ ID:5408.

[90532] Another function of VGAM2697 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. Activity-dependent Neuroprotector (ADNP, Accession NM_015339) is another VGAM2697 host target gene. ADNP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADNP BINDING SITE, designated SEQ ID:17646, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90533] Another function of VGAM2697 is therefore inhibition of Activity-dependent Neuroprotector (ADNP, Accession NM_015339). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADNP. ATP6M8-9 (Accession NM_005765) is another VGAM2697 host target

gene. ATP6M8-9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP6M8-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6M8-9 BINDING SITE, designated SEQ ID:12328, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90534] Another function of VGAM2697 is therefore inhibition of ATP6M8-9 (Accession NM_005765). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6M8-9. KIAA0830 (Accession XM_045759) is another VGAM2697 host target gene. KIAA0830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0830 BINDING SITE, designated SEQ ID:34545, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90535] Another function of VGAM2697 is therefore inhibition of KIAA0830 (Accession XM_045759). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0830. LOC135932 (Accession XM_072433) is another VGAM2697 host target gene. LOC135932 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC135932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135932 BINDING SITE, designated SEQ ID:37498, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90536] Another function of VGAM2697 is therefore inhibition of LOC135932 (Accession XM_072433). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135932. LOC154760 (Accession XM_098603) is another VGAM2697 host target gene. LOC154760 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154760, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154760 BINDING SITE, designated SEQ ID:41724, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90537] Another function of VGAM2697 is therefore inhibition of LOC154760 (Accession XM_098603). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154760. LOC91266 (Accession XM_037268) is another VGAM2697 host target gene. LOC91266 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:32605, to the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, also designated SEQ ID:5408.

[90538] Another function of VGAM2697 is therefore inhibition of LOC91266 (Accession XM_037268). Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2698 (VGAM2698) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90539] VGAM2698 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2698 was detected is described hereinabove with reference to Figs. 1-8.

[90540] VGAM2698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paprika Mild Mottle Virus. VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90541] VGAM2698 gene encodes a VGAM2698 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2698 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2698 precursor RNA is designated SEQ ID:2684, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2684 is located at position 1275 relative to the genome of Paprika Mild Mottle Virus.

[90542] VGAM2698 precursor RNA folds onto itself, forming VGAM2698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90543] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2698 folded precursor RNA into VGAM2698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2698 RNA is designated SEQ ID:5409, and is provided hereinbelow with reference to the sequence listing part.

[90544] VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2698 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90545] VGAM2698 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2698 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2698 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90546] The complementary binding of VGAM2698 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2698 host target RNA into VGAM2698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90547] It is appreciated that VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2698 host target genes. The mRNA of each one of this plurality of VGAM2698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2698 RNA, herein designated VGAM RNA, and which when bound by VGAM2698 RNA causes

inhibition of translation of respective one or more VGAM2698 host target proteins.

[90548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2698 gene, herein designated VGAM GENE, on one or more VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90549] It is yet further appreciated that a function of VGAM2698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2698 include diagnosis, prevention and

treatment of viral infection by Paprika Mild Mottle Virus. Specific functions, and accordingly utilities, of VGAM2698 correlate with, and may be deduced from, the identity of the host target genes which VGAM2698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90550] Nucleotide sequences of the VGAM2698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2698 are further described hereinbelow with reference to Table 1.

[90551] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2698 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90552] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2698 gene, herein designated VGAM is inhibition of expression of VGAM2698 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2698 correlate with, and may be deduced from, the identity of the target genes which VGAM2698 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90553] Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM_000025) is a VGAM2698 host target gene. ADRB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADRB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRB3 BINDING SITE, designated SEQ ID:5462, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90554] A function of VGAM2698 is therefore inhibition of Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM_000025), a gene which stimulates adenylyl cyclase activity and regulates lipolysis. Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRB3. The function of ADRB3 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM179.Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM_000706) is another VGAM2698 host target gene. AVPR1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AVPR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AVPR1A BINDING SITE, designated SEQ ID:6374, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90555] Another function of VGAM2698 is therefore inhibition of Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM_000706), a gene which mediates cell contraction and proliferation, platelet aggregation, release of coagulation factor, and glycogenolysis. Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AVPR1A. The function of AVPR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM549.B-cell CLL/lymphoma 2 (BCL2, Ac-

cession NM_000633) is another VGAM2698 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6253, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90556] Another function of VGAM2698 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993) is another VGAM2698 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21991, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5409.

[90557] Another function of VGAM2698 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377) is another VGAM2698 host target gene. MYCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:11857, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90558] Another function of VGAM2698 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2. Synapsin III (SYN3, Accession NM_133632) is

another VGAM2698 host target gene. SYN3 BINDING SITE1 through SYN3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SYN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYN3 BINDING SITE1 through SYN3 BINDING SITE3, designated SEQ ID:28593, SEQ ID:28595 and SEQ ID:9584 respectively, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90559] Another function of VGAM2698 is therefore inhibition of Synapsin III (SYN3, Accession NM_133632), a gene which may be involved in the regulation of neurotransmitter release and synaptogenesis. Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYN3. The function of SYN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM925.FLJ31952 (Accession NM_144682) is another VGAM2698 host target gene. FLJ31952 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ31952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31952 BINDING SITE, designated SEQ ID:29498, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90560] Another function of VGAM2698 is therefore inhibition of FLJ31952 (Accession NM_144682). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31952. HSOBRGRP (Accession NM_017526) is another VGAM2698 host target gene. HSOBRGRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSOBRGRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSOBRGRP BINDING SITE, designated SEQ ID:18970, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90561] Another function of VGAM2698 is therefore inhibition of HSOBRGRP (Accession NM_017526). Accordingly, utilities

of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSOBRGRP. Myelin Transcription Factor 1-like (MYT1L, Accession XM_039762) is another VGAM2698 host target gene. MYT1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MYT1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYT1L BINDING SITE, designated SEQ ID:33184, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90562] Another function of VGAM2698 is therefore inhibition of Myelin Transcription Factor 1-like (MYT1L, Accession XM_039762). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYT1L. TUSP (Accession NM_020245) is another VGAM2698 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21535, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90563] Another function of VGAM2698 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC145225 (Accession XM_096741) is another VGAM2698 host target gene. LOC145225 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145225 BINDING SITE, designated SEQ ID:40525, to the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, also designated SEQ ID:5409.

[90564] Another function of VGAM2698 is therefore inhibition of LOC145225 (Accession XM_096741). Accordingly, utilities of VGAM2698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145225. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2699 (VGAM2699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90565] VGAM2699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2699 was detected is described hereinabove with reference to Figs. 1-8.

[90566] VGAM2699 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paprika Mild Mottle Virus. VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90567] VGAM2699 gene encodes a VGAM2699 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2699 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2699 precursor RNA is designated SEQ ID:2685, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2685 is located at position 2770 relative to the genome of Paprika Mild Mottle Virus.

[90568] VGAM2699 precursor RNA folds onto itself, forming VGAM2699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90569] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2699 folded precursor RNA into VGAM2699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM2699 RNA is designated SEQ ID:5410, and is provided hereinbelow with reference to the sequence listing part.

[90570] VGAM2699 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2699 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90571] VGAM2699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2699 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2699 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90572] The complementary binding of VGAM2699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2699 host target RNA into VGAM2699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90573] It is appreciated that VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2699 host target genes. The mRNA of each one of this plurality of VGAM2699 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2699 RNA, herein designated VGAM RNA, and which when bound by VGAM2699 RNA causes inhibition of translation of respective one or more

VGAM2699 host target proteins.

[90574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2699 gene, herein designated VGAM GENE, on one or more VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90575] It is yet further appreciated that a function of VGAM2699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of viral infection by Paprika Mild Mottle Virus.

Specific functions, and accordingly utilities, of VGAM2699 correlate with, and may be deduced from, the identity of the host target genes which VGAM2699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90576] Nucleotide sequences of the VGAM2699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2699 are further described hereinbelow with reference to Table 1.

[90577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2699 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2699 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90578] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2699 gene, herein designated VGAM is inhibition of expression of VGAM2699 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2699 correlate with, and may be deduced from, the identity of the target genes which VGAM2699 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90579] ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is a VGAM2699 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6365, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90580] A function of VGAM2699 is therefore inhibition of ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357) is another VGAM2699 host target gene. CASP8 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by CASP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:27208, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90581] Another function of VGAM2699 is therefore inhibition of Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM145.Chloride Channel 3 (CLCN3, Accession NM_001829) is another VGAM2699 host target gene. CLCN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLCN3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN3 BINDING SITE, designated SEQ ID:7565, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90582] Another function of VGAM2699 is therefore inhibition of Chloride Channel 3 (CLCN3, Accession NM_001829), a gene which play a role in the neural cell function through regulation of membrane excitability. Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN3. The function of CLCN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332.Collagen-like Tail Subunit (single strand of homotrimer) of Asymmetric Acetylcholinesterase (COLQ, Accession NM_005677) is another VGAM2699 host target gene. COLQ BINDING SITE1 through COLQ BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COLQ, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of COLQ BINDING SITE1 through COLQ BINDING SITE6, designated SEQ ID:12231, SEQ ID:27851, SEQ ID:27854, SEQ ID:27857, SEQ ID:27860 and SEQ ID:27863 respectively, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90583] Another function of VGAM2699 is therefore inhibition of Collagen-like Tail Subunit (single strand of homotrimer) of Asymmetric Acetylcholinesterase (COLQ, Accession NM_005677). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ. Islet Cell Autoantigen 1, 69kDa (ICA1, Accession NM_022308) is another VGAM2699 host target gene. ICA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICA1 BINDING SITE, designated SEQ ID:22739, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90584] Another function of VGAM2699 is therefore inhibition of

Islet Cell Autoantigen 1, 69kDa (ICA1, Accession NM_022308), a gene which Islet cell autoantigen 1. Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICA1. The function of ICA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.RNA Binding Motif Protein, X Chromosome (RBMX, Accession XM_042968) is another VGAM2699 host target gene. RBMX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBMX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBMX BINDING SITE, designated SEQ ID:33858, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90585] Another function of VGAM2699 is therefore inhibition of RNA Binding Motif Protein, X Chromosome (RBMX, Accession XM_042968), a gene which binds rna as a component of the ribonucleosome. Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RBMX. The function of RBMX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1043.Zinc Finger Protein 255 (ZNF255, Accession NM_005774) is another VGAM2699 host target gene. ZNF255 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF255 BINDING SITE, designated SEQ ID:12348, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90586] Another function of VGAM2699 is therefore inhibition of Zinc Finger Protein 255 (ZNF255, Accession NM_005774). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF255. Zinc Finger Protein 268 (ZNF268, Accession XM_031851) is another VGAM2699 host target gene. ZNF268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by ZNF268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF268 BINDING SITE, designated SEQ ID:31501, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90587] Another function of VGAM2699 is therefore inhibition of Zinc Finger Protein 268 (ZNF268, Accession XM_031851). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF268. Chromosome 20 Open Reading Frame 97 (C20orf97, Accession NM_021158) is another VGAM2699 host target gene. C20orf97 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf97, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf97 BINDING SITE, designated SEQ ID:22139, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90588] Another function of VGAM2699 is therefore inhibition of

Chromosome 20 Open Reading Frame 97 (C20orf97, Accession NM_021158). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf97. Reserved (C8orf13, Accession XM_088377) is another VGAM2699 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39652, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90589] Another function of VGAM2699 is therefore inhibition of Reserved (C8orf13, Accession XM_088377). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. FLJ13224 (Accession NM_024799) is another VGAM2699 host target gene. FLJ13224 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13224, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13224 BINDING SITE, designated SEQ ID:24178, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90590] Another function of VGAM2699 is therefore inhibition of FLJ13224 (Accession NM_024799). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13224. FLJ20209 (Accession XM_098142) is another VGAM2699 host target gene. FLJ20209 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20209 BINDING SITE, designated SEQ ID:41404, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90591] Another function of VGAM2699 is therefore inhibition of FLJ20209 (Accession XM_098142). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20209. KIAA0217 (Accession XM_040265) is another VGAM2699 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33281, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90592] Another function of VGAM2699 is therefore inhibition of KIAA0217 (Accession XM_040265). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. KIAA0980 (Accession NM_025176) is another VGAM2699 host target gene. KIAA0980 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0980 BINDING SITE, designated SEQ ID:24811, to the nucleotide sequence of VGAM2699 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5410.

[90593] Another function of VGAM2699 is therefore inhibition of KIAA0980 (Accession NM_025176). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0980. KIAA1130 (Accession XM_031104) is another VGAM2699 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31286, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90594] Another function of VGAM2699 is therefore inhibition of KIAA1130 (Accession XM_031104). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1204 (Accession XM_045011) is another VGAM2699 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1204, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34314, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90595] Another function of VGAM2699 is therefore inhibition of KIAA1204 (Accession XM_045011). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204. KIAA1281 (Accession XM_114432) is another VGAM2699 host target gene. KIAA1281 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1281 BINDING SITE, designated SEQ ID:42962, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90596] Another function of VGAM2699 is therefore inhibition of KIAA1281 (Accession XM_114432). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1281. KIAA1727 (Accession XM_034262) is another VGAM2699 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32029, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90597] Another function of VGAM2699 is therefore inhibition of KIAA1727 (Accession XM_034262). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1879 (Accession XM_056635) is another VGAM2699 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36416, to the

nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90598] Another function of VGAM2699 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. KIAA1938 (Accession XM_166407) is another VGAM2699 host target gene. KIAA1938 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1938 BINDING SITE, designated SEQ ID:44278, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90599] Another function of VGAM2699 is therefore inhibition of KIAA1938 (Accession XM_166407). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1938. Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM_033335) is another VGAM2699 host target gene. NR6A1 BINDING SITE1

through NR6A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR6A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3, designated SEQ ID:27186, SEQ ID:27180 and SEQ ID:7232 respectively, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90600] Another function of VGAM2699 is therefore inhibition of Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM_033335). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR6A1. RNAC (Accession NM_005772) is another VGAM2699 host target gene. RNAC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAC BINDING SITE, designated SEQ ID:12345, to the nucleotide sequence of VGAM2699 RNA,

herein designated VGAM RNA, also designated SEQ ID:5410.

[90601] Another function of VGAM2699 is therefore inhibition of RNAC (Accession NM_005772). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNAC. U5-116KD (Accession NM_004247) is another VGAM2699 host target gene. U5-116KD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by U5-116KD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-116KD BINDING SITE, designated SEQ ID:10436, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90602] Another function of VGAM2699 is therefore inhibition of U5-116KD (Accession NM_004247). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD. LOC146909 (Accession XM_085634) is another VGAM2699 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38272, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90603] Another function of VGAM2699 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC152445 (Accession XM_098231) is another VGAM2699 host target gene. LOC152445 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:41510, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90604] Another function of VGAM2699 is therefore inhibition of LOC152445 (Accession XM_098231). Accordingly, utilities

of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445. LOC158476 (Accession XM_098955) is another VGAM2699 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41998, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90605] Another function of VGAM2699 is therefore inhibition of LOC158476 (Accession XM_098955). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC223009 (Accession XM_170214) is another VGAM2699 host target gene. LOC223009 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC223009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC223009 BINDING SITE, designated SEQ ID:45313, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90606] Another function of VGAM2699 is therefore inhibition of LOC223009 (Accession XM_170214). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC223009. LOC256158 (Accession XM_175125) is another VGAM2699 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46618, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90607] Another function of VGAM2699 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC257444 (Accession XM_088028) is another VGAM2699 host target gene. LOC257444 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257444 BINDING SITE, designated SEQ ID:39479, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90608] Another function of VGAM2699 is therefore inhibition of LOC257444 (Accession XM_088028). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257444. LOC56267 (Accession NM_019610) is another VGAM2699 host target gene. LOC56267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56267 BINDING SITE, designated SEQ ID:21229, to the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, also designated SEQ ID:5410.

[90609] Another function of VGAM2699 is therefore inhibition of

LOC56267 (Accession NM_019610). Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56267. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2700 (VGAM2700) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90610] VGAM2700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2700 was detected is described hereinabove with reference to Figs. 1-8.

[90611] VGAM2700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of La Crosse Virus. VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90612] VGAM2700 gene encodes a VGAM2700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2700 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2700 precursor RNA is designated SEQ ID:2686, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2686 is located at position 1021 relative to the genome of La Crosse Virus.

[90613] VGAM2700 precursor RNA folds onto itself, forming VGAM2700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90614] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2700 folded precursor RNA into VGAM2700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2700 RNA is designated SEQ ID:5411, and is provided hereinbelow with reference to the sequence listing part.

[90615] VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2700 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90616] VGAM2700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2700 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90617] The complementary binding of VGAM2700 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2700 host target RNA into VGAM2700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90618] It is appreciated that VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2700 host target genes. The mRNA of each one of this plurality of VGAM2700 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2700 RNA, herein designated VGAM RNA, and which when bound by VGAM2700 RNA causes inhibition of translation of respective one or more VGAM2700 host target proteins.

[90619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2700 gene, herein designated VGAM GENE, on one or more VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90620] It is yet further appreciated that a function of VGAM2700

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2700 include diagnosis, prevention and treatment of viral infection by La Crosse Virus. Specific functions, and accordingly utilities, of VGAM2700 correlate with, and may be deduced from, the identity of the host target genes which VGAM2700 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90621] Nucleotide sequences of the VGAM2700 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2700 are further described hereinbelow with reference to Table 1.

[90622] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2700 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90623] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2700 gene, herein designated VGAM is inhibition of expression of VGAM2700 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2700 correlate with, and may be deduced from, the identity of the target genes which VGAM2700 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90624] Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165) is a VGAM2700 host target gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:5679, to the nucleotide sequence of VGAM2700 RNA, herein designated VGAM RNA, also designated SEQ ID:5411.

[90625] A function of VGAM2700 is therefore inhibition of Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM2700 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.RAB Interacting Factor (RABIF, Accession NM_002871) is another VGAM2700 host target gene. RABIF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABIF BINDING SITE, designated SEQ ID:8780, to the nucleotide sequence of VGAM2700 RNA, herein designated VGAM RNA, also designated SEQ ID:5411.

[90626] Another function of VGAM2700 is therefore inhibition of RAB Interacting Factor (RABIF, Accession NM_002871), a gene which is involved in the regulation of intracellular vesicular transport. Accordingly, utilities of VGAM2700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABIF. The function of RABIF and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM1633.Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM_080821) is another VGAM2700 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28089, to the nucleotide sequence of VGAM2700 RNA, herein designated VGAM RNA, also designated SEQ ID:5411.

[90627] Another function of VGAM2700 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM_080821). Accordingly, utilities of VGAM2700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2701 (VGAM2701) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[90628] VGAM2701 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2701 was detected is described hereinabove with reference to Figs. 1-8.

[90629] VGAM2701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of La Crosse Virus. VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90630] VGAM2701 gene encodes a VGAM2701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2701 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2701 precursor RNA is designated SEQ ID:2687, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2687 is located at position 4064 relative to the genome of La Crosse Virus.

[90631] VGAM2701 precursor RNA folds onto itself, forming VGAM2701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90632] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2701 folded precursor RNA into VGAM2701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2701 RNA is designated SEQ ID:5412, and is provided hereinbelow with reference to the sequence listing part.

[90633] VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2701 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90634] VGAM2701 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2701 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2701 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[90635] The complementary binding of VGAM2701 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2701 host target RNA into VGAM2701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90636] It is appreciated that VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2701 host target genes. The mRNA of each one of this plurality of VGAM2701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2701 RNA, herein designated VGAM RNA, and which when bound by VGAM2701 RNA causes inhibition of translation of respective one or more VGAM2701 host target proteins.

[90637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2701 gene, herein designated VGAM GENE, on one

or more VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90638] It is yet further appreciated that a function of VGAM2701 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2701 include diagnosis, prevention and treatment of viral infection by La Crosse Virus. Specific functions, and accordingly utilities, of VGAM2701 correlate with, and may be deduced from, the identity of the host target genes which VGAM2701 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90639] Nucleotide sequences of the VGAM2701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2701 are further described hereinbelow with reference to Table 1.

[90640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2701 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90641] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2701 gene, herein designated VGAM is inhibition of expression of VGAM2701 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2701 correlate with, and may be deduced from, the identity of the target genes which VGAM2701 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90642] Fibroblast Growth Factor 5 (FGF5, Accession NM_004464)

is a VGAM2701 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10771 and SEQ ID:26998 respectively, to the nucleotide sequence of VGAM2701 RNA, herein designated VGAM RNA, also designated SEQ ID:5412.

[90643] A function of VGAM2701 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM2701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.LOC90333 (Accession XM_030958) is another VGAM2701 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90333, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31221, to the nucleotide sequence of VGAM2701 RNA, herein designated VGAM RNA, also designated SEQ ID:5412.

[90644] Another function of VGAM2701 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM2701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2702 (VGAM2702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90645] VGAM2702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2702 was detected is described hereinabove with reference to Figs. 1-8.

[90646] VGAM2702 gene, herein designated VGAM GENE, is a viral gene contained in the genome of La Crosse Virus.

VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90647] VGAM2702 gene encodes a VGAM2702 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2702 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2702 precursor RNA is designated SEQ ID:2688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2688 is located at position 4272 relative to the genome of La Crosse Virus.

[90648] VGAM2702 precursor RNA folds onto itself, forming VGAM2702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90649] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2702 folded precursor RNA into VGAM2702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2702 RNA is designated SEQ ID:5413, and is provided hereinbelow with reference to the sequence listing part.

[90650] VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2702 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90651] VGAM2702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2702 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2702 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90652] The complementary binding of VGAM2702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2702 host target RNA into VGAM2702 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90653] It is appreciated that VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2702 host target genes. The mRNA of each one of this plurality of VGAM2702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2702 RNA, herein designated VGAM RNA, and which when bound by VGAM2702 RNA causes inhibition of translation of respective one or more VGAM2702 host target proteins.

[90654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2702 gene, herein designated VGAM GENE, on one or more VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90655] It is yet further appreciated that a function of VGAM2702 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of viral infection by La Crosse Virus. Specific functions, and accordingly utilities, of VGAM2702 correlate with, and may be deduced from, the identity of the host target genes which VGAM2702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90656] Nucleotide sequences of the VGAM2702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2702 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2702 are further described hereinbelow with reference to Table 1.

[90657] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2702 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90658] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2702 gene, herein designated VGAM is inhibition of expression of VGAM2702 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2702 correlate with, and may be deduced from, the identity of the target genes which VGAM2702 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90659] Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586) is a VGAM2702 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15944,

to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90660] A function of VGAM2702 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132) is another VGAM2702 host target gene. HABP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:10341, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90661] Another function of VGAM2702 is therefore inhibition of Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2. KIAA1023 (Accession NM_017604) is another VGAM2702 host target

gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19085, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90662] Another function of VGAM2702 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575) is another VGAM2702 host target gene. OR2C3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OR2C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:37176, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA,

also designated SEQ ID:5413.

[90663] Another function of VGAM2702 is therefore inhibition of Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2C3. TERA (Accession NM_021238) is another VGAM2702 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:22203, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90664] Another function of VGAM2702 is therefore inhibition of TERA (Accession NM_021238). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. LOC147949 (Accession XM_085973) is another VGAM2702 host target gene. LOC147949 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC147949, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147949 BINDING SITE, designated SEQ ID:38422, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90665] Another function of VGAM2702 is therefore inhibition of LOC147949 (Accession XM_085973). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147949. LOC155179 (Accession XM_088169) is another VGAM2702 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39553, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90666] Another function of VGAM2702 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities

of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC158267 (Accession XM_088528) is another VGAM2702 host target gene. LOC158267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158267 BINDING SITE, designated SEQ ID:39790, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90667] Another function of VGAM2702 is therefore inhibition of LOC158267 (Accession XM_088528). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158267. LOC90161 (Accession XM_029551) is another VGAM2702 host target gene. LOC90161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90161 BINDING SITE, designated SEQ ID:30901, to the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, also designated SEQ ID:5413.

[90668] Another function of VGAM2702 is therefore inhibition of LOC90161 (Accession XM_029551). Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2703 (VGAM2703) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90669] VGAM2703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2703 was detected is described hereinabove with reference to Figs. 1-8.

[90670] VGAM2703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mamestra Configurata Nucleopolyhedrovirus B. VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90671] VGAM2703 gene encodes a VGAM2703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2703 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2703 precursor RNA is designated SEQ ID:2689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2689 is located at position 133043 relative to the genome of Mamestra Configurata Nucleopolyhedrovirus B.

[90672] VGAM2703 precursor RNA folds onto itself, forming VGAM2703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90673] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2703 folded precursor RNA into VGAM2703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2703 RNA is designated SEQ ID:5414, and is provided hereinbelow with reference to the sequence listing part.

[90674] VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2703 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90675] VGAM2703 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2703 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2703 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90676] The complementary binding of VGAM2703 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2703 host target RNA into VGAM2703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90677] It is appreciated that VGAM2703 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2703 host target genes. The mRNA of each one of this plurality of VGAM2703 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2703 RNA, herein designated VGAM RNA, and which when bound by VGAM2703 RNA causes inhibition of translation of respective one or more VGAM2703 host target proteins.

[90678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2703 gene, herein designated VGAM GENE, on one or more VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90679] It is yet further appreciated that a function of VGAM2703 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2703 include diagnosis, prevention and treatment of viral infection by Mamestra Configurata Nucleopolyhedrovirus B. Specific functions, and accordingly utilities, of VGAM2703 correlate with, and may be deduced from, the identity of the host target genes which VGAM2703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90680] Nucleotide sequences of the VGAM2703 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2703 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2703 are further described hereinbelow with reference to Table 1.

[90681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2703 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90682] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2703 gene, herein designated VGAM is inhibition of expression of VGAM2703 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2703 correlate with, and may be deduced from, the identity of the target genes which VGAM2703 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90683] Chromosome 5 Open Reading Frame 3 (C5orf3, Accession NM_018691) is a VGAM2703 host target gene. C5orf3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5orf3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf3 BINDING SITE, designated SEQ ID:20763, to the nucleotide sequence of VGAM2703 RNA, herein designated VGAM RNA, also designated SEQ ID:5414.

[90684] A function of VGAM2703 is therefore inhibition of Chro-

mosome 5 Open Reading Frame 3 (C5orf3, Accession NM_018691). Accordingly, utilities of VGAM2703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf3. FLJ21870 (Accession NM_023016) is another VGAM2703 host target gene. FLJ21870 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21870 BINDING SITE, designated SEQ ID:23281, to the nucleotide sequence of VGAM2703 RNA, herein designated VGAM RNA, also designated SEQ ID:5414.

[90685] Another function of VGAM2703 is therefore inhibition of FLJ21870 (Accession NM_023016). Accordingly, utilities of VGAM2703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21870. MGC2452 (Accession NM_032644) is another VGAM2703 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26364, to the nucleotide sequence of VGAM2703 RNA, herein designated VGAM RNA, also designated SEQ ID:5414.

[90686] Another function of VGAM2703 is therefore inhibition of MGC2452 (Accession NM_032644). Accordingly, utilities of VGAM2703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2704 (VGAM2704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90687] VGAM2704 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2704 was detected is described hereinabove with reference to Figs. 1-8.

[90688] VGAM2704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mamestra Configurata Nucleopolyhedrovirus B. VGAM2704 host target gene,

herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90689] VGAM2704 gene encodes a VGAM2704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2704 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2704 precursor RNA is designated SEQ ID:2690, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2690 is located at position 133581 relative to the genome of Mamestra Configurata Nucleopolyhedrovirus B.

[90690] VGAM2704 precursor RNA folds onto itself, forming VGAM2704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90691] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2704 folded precursor RNA into VGAM2704

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM2704 RNA is designated SEQ ID:5415, and is provided hereinbelow with reference to the sequence listing part.

[90692] VGAM2704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2704 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90693] VGAM2704 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2704 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90694] The complementary binding of VGAM2704 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2704 host target RNA into VGAM2704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[90695] It is appreciated that VGAM2704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2704 host target genes. The mRNA of each one of this plurality of VGAM2704 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2704 RNA, herein designated VGAM RNA, and which when bound by VGAM2704 RNA causes inhibition of translation of respective one or more VGAM2704 host target proteins.

[90696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2704 gene, herein designated VGAM GENE, on one or more VGAM2704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90697] It is yet further appreciated that a function of VGAM2704 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2704 include diagnosis, prevention and treatment of viral infection by Mamestra Configurata Nucleopolyhedrovirus B. Specific functions, and accordingly utilities, of VGAM2704 correlate with, and may be deduced from, the identity of the host target genes which VGAM2704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90698] Nucleotide sequences of the VGAM2704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2704 are further described hereinbelow with reference to Table 1.

[90699] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2704 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90700] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2704 gene, herein designated VGAM is inhibition of expression of VGAM2704 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2704 correlate with, and may be deduced from, the identity of the target genes which VGAM2704 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90701] Calumenin (CALU, Accession NM_001219) is a VGAM2704 host target gene. CALU BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:6888, to the nucleotide sequence of VGAM2704 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5415.

[90702] A function of VGAM2704 is therefore inhibition of Calumenin (CALU, Accession NM_001219), a gene which binds 7 calcium ions with a low affinity with unidtified function. Accordingly, utilities of VGAM2704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALU. The function of CALU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM253.LAG1 Longevity Assurance Homolog 2 (S. cerevisiae) (LASS2, Accession XM_041889) is another VGAM2704 host target gene. LASS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LASS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASS2 BINDING SITE, designated SEQ ID:33624, to the nucleotide sequence of VGAM2704 RNA, herein designated VGAM RNA, also designated SEQ ID:5415.

[90703] Another function of VGAM2704 is therefore inhibition of LAG1 Longevity Assurance Homolog 2 (S. cerevisiae)

(LASS2, Accession XM_041889). Accordingly, utilities of VGAM2704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASS2. LOC51339 (Accession NM_016651) is another VGAM2704 host target gene. LOC51339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51339 BINDING SITE, designated SEQ ID:18769, to the nucleotide sequence of VGAM2704 RNA, herein designated VGAM RNA, also designated SEQ ID:5415.

[90704] Another function of VGAM2704 is therefore inhibition of LOC51339 (Accession NM_016651). Accordingly, utilities of VGAM2704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51339. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2705 (VGAM2705) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[90705] VGAM2705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2705 was detected is described hereinabove with reference to Figs. 1-8.

[90706] VGAM2705 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Heliothis Zea Virus 1 (HZV-1). VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90707] VGAM2705 gene encodes a VGAM2705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2705 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2705 precursor RNA is designated SEQ ID:2691, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2691 is located at position 81066 relative to the genome of Heliothis Zea Virus 1 (HZV-1).

[90708] VGAM2705 precursor RNA folds onto itself, forming VGAM2705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90709] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2705 folded precursor RNA into VGAM2705 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2705 RNA is designated SEQ ID:5416, and is provided hereinbelow with reference to the sequence listing part.

[90710] VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2705 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90711] VGAM2705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2705 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90712] The complementary binding of VGAM2705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2705 host target RNA into VGAM2705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90713] It is appreciated that VGAM2705 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2705 host target genes. The mRNA of each one of this plurality of VGAM2705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2705 RNA, herein designated VGAM RNA, and which when bound by VGAM2705 RNA causes inhibition of translation of respective one or more VGAM2705 host target proteins.

[90714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2705 gene, herein designated VGAM GENE, on one or more VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90715] It is yet further appreciated that a function of VGAM2705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of viral infection by Heliothis Zea Virus 1 (HZV-1). Specific functions, and accordingly utilities, of VGAM2705 correlate with, and may be deduced from, the identity of the host target genes which VGAM2705 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90716] Nucleotide sequences of the VGAM2705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2705 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2705 are further described hereinbelow with reference to Table 1.

[90717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2705 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2705 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90718] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2705 gene, herein designated VGAM is inhibition of expression of VGAM2705 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2705 correlate with, and may be deduced from, the identity of the target genes which VGAM2705 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90719] Adenosine Monophosphate Deaminase (isoform E) (AMPD3, Accession NM_000480) is a VGAM2705 host target gene. AMPD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMPD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMPD3 BINDING SITE, designated SEQ ID:6089, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90720] A function of VGAM2705 is therefore inhibition of Adenosine Monophosphate Deaminase (isoform E) (AMPD3, Accession NM_000480), a gene which plays a critical role in energy metabolism. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMPD3. The function of AMPD3 has been established by previous studies. Yamada et al. (1992) determined the nucleotide sequence of erythrocyte cDNA. The 3.7-kb cDNA contained an open reading frame of 2,301 bp that encodes 767 amino acids to form an 89-kD protein. Whereas both the AMPD1 and AMPD2 genes are situated in the 1p21-p13 region of chromosome 1, Eddy et al. (1993) demonstrated that the AMPD3 gene is located on chromosome 11 in the region pter-p13. Sermsuvitayawong et al. (1997) demonstrated that the Ampd3 gene is located on mouse chromosome 7 in a region of conserved linkage homology with human 11p. The mouse homolog, however, has a different gene structure in the 5-prime region, the gene products are reported to be immunologically distinct, and Sermsuvitayawong et al. (1997) referred to the Ampd3 gene as the heart-type AMPD. Ogasawara et al. (1987) observed 6 related individuals with complete deficiency of erythrocyte

AMP deaminase. All were healthy and had no hematologic disorders. The deficiency was limited to isozyme E, which is the red cell type. The deficiency was inherited as an autosomal recessive trait as demonstrated by the fact that both parents had partial deficiency in each case in which this could be studied and all children of completely deficient individuals were partially deficient. The frequency of the mutant gene was surprisingly high; heterozygotes had a frequency of about 1 in 30 in Japan, Seoul, and Taipei. The ATP level was approximately 50% higher in AMP-deficient red cells compared to the level in the control cells. Degradation of adenine nucleotide was slower in the deficient erythrocytes than in the control erythrocytes. Yamada et al. (1994) stated that AMPD3 deficiency had been found in Europe and that the frequency in northern Poland was almost the same as that in east Asia.

[90721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[90722] Ogasawara, N.; Goto, H.; Yamada, Y.; Nishigaki, I.; Itoh, T.; Hasegawa, I.; Park, K. S. : Deficiency of AMP deaminase in erythrocytes. Hum. Genet. 75: 15-18, 1987. ; and

[90723] Yamada, Y.; Goto, H.; Ogasawara, N. : A point mutation

responsible for human erythrocyte AMP deaminase deficiency. Hum. Molec. Genet. 3: 331-334, 1994.

[90724] Further studies establishing the function and utilities of AMPD3 are found in John Hopkins OMIM database record ID 102772, and in sited publications numbered 12767-12771 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is another VGAM2705 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:9519, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90725] Another function of VGAM2705 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with BSN. The function of BSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM638.Nuclear Protein, Ataxia-telangiectasia Locus (NPAT, Accession XM_040846) is another VGAM2705 host target gene. NPAT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPAT BINDING SITE, designated SEQ ID:33388, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90726] Another function of VGAM2705 is therefore inhibition of Nuclear Protein, Ataxia-telangiectasia Locus (NPAT, Accession XM_040846), a gene which is expressed in all tissues. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPAT. The function of NPAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM376.Otoraplin

(OTOR, Accession NM_020157) is another VGAM2705 host target gene. OTOR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OTOR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTOR BINDING SITE, designated SEQ ID:21367, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90727] Another function of VGAM2705 is therefore inhibition of Otoraplin (OTOR, Accession NM_020157), a gene which plays a role in the early chondrogenesis of the periotic mesenchyme. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTOR. The function of OTOR has been established by previous studies. During large-scale analysis of human fetal cochlea EST sequences, Robertson et al. (2000) identified a novel gene, designated OTOR. They also isolated orthologous genes in mouse, chicken, and bullfrog by screening inner ear cDNA libraries. Rendtorff et al. (2001) independently identified OTOR, which they called MIA-like (MIAL), during a search

for cochlea-specific EST clusters. Cohen-Salmon et al. (2000) cloned the mouse Otor gene, which they called fibrocyte-derived protein (Fdp), using a subtracted mouse cochlea cDNA library and 5-prime RACE. Human OTOR encodes a 128-amino acid protein with a predicted secretion signal peptide. The protein shares high sequence identity with the mouse (90%), chicken (80%), and bullfrog (60%) orthologs and with the related human CDRAP/MIA protein (OMIM Ref. No. 601340) (43%). By expressing OTOR in mammalian cell cultures, Rendtorff et al. (2001) showed that OTOR is translated as an approximately 15-kD polypeptide that is assembled into a covalently linked homodimer, modified by sulfation, and secreted from the cells via the Golgi apparatus. By Northern blot analysis, Robertson et al. (2000) detected expression of a major 1.1-kb and minor 1.8- and 4-kb OTOR transcripts in human cochlea. Using RT-PCR and in situ hybridization, Rendtorff et al. (2001) detected OTOR expression specific to a cell layer beneath the sensory epithelium of cochlea and vestibule of human fetal inner ear. Rendtorff et al. (2001) reported a frequent polymorphism in the translation initiation codon of OTOR (ACG instead of ATG). Of 505 unrelated individuals analyzed, 9.5% were ACG/ATG

heterozygous. The ACG allele failed to direct synthesis of the OTOR protein in transfected cells. Rendtorff et al. (2001) concluded that OTOR may contribute to inner ear dysfunction in humans.

[90728] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[90729] Rendtorff, N. D.; Frodin, M.; Attie-Bitach, T.; Vekemans, M.; Tommerup, N. : Identification and characterization of an inner ear-expressed human melanoma inhibitory activity (MIA)-like gene (MIAL) with a frequent polymorphism that abolishes translation. Genomics 71: 40-52, 2001. ; and

[90730] Robertson, N. G.; Heller, S.; Lin, J. S.; Resendes, B. L.; Weremowicz, S.; Denis, C. S.; Bell, A. M.; Hudspeth, A. J.; Morton, C. C. : A novel conserved cochlear gene, OTOR: identificati.

[90731] Further studies establishing the function and utilities of OTOR are found in John Hopkins OMIM database record ID 606067, and in sited publications numbered 4496-4498 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Synaptotagmin I (SYT1, Accession NM_005639) is another VGAM2705 host

target gene. SYT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT1 BINDING SITE, designated SEQ ID:12171, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90732] Another function of VGAM2705 is therefore inhibition of Synaptotagmin I (SYT1, Accession NM_005639), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles at the active zone of the synapse. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT1. The function of SYT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM739.T, Brachyury Homolog (mouse) (T, Accession NM_003181) is another VGAM2705 host target gene. T BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by T, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of T BINDING SITE, designated SEQ ID:9154, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90733] Another function of VGAM2705 is therefore inhibition of T, Brachyury Homolog (mouse) (T, Accession NM_003181), a gene which is a potent transcription factor. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with T. The function of T and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1083.V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433) is another VGAM2705 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:11916, to the nucleotide sequence of

VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90734] Another function of VGAM2705 is therefore inhibition of V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433), a gene which is a putative protein-tyrosine kinase. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Rho Guanine Nucleotide Exchange Factor (GEF) 10 (ARHGEF10, Accession XM_017169) is another VGAM2705 host target gene. ARHGEF10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF10 BINDING SITE, designated SEQ ID:30305, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90735] Another function of VGAM2705 is therefore inhibition of

Rho Guanine Nucleotide Exchange Factor (GEF) 10 (ARHGEF10, Accession XM_017169). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF10. CD109 (Accession NM_133493) is another VGAM2705 host target gene. CD109 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD109 BINDING SITE, designated SEQ ID:28572, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90736] Another function of VGAM2705 is therefore inhibition of CD109 (Accession NM_133493). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD109. FLJ12934 (Accession NM_022899) is another VGAM2705 host target gene. FLJ12934 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12934 BINDING SITE, designated SEQ ID:23177, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90737] Another function of VGAM2705 is therefore inhibition of FLJ12934 (Accession NM_022899). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12934. KIAA0014 (Accession NM_014665) is another VGAM2705 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16117, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90738] Another function of VGAM2705 is therefore inhibition of KIAA0014 (Accession NM_014665). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0014. KIAA0092 (Accession NM_014679) is another VGAM2705 host target gene. KIAA0092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0092 BINDING SITE, designated SEQ ID:16157, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90739] Another function of VGAM2705 is therefore inhibition of KIAA0092 (Accession NM_014679). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0092. KIAA0318 (Accession XM_044334) is another VGAM2705 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34185, to the nucleotide sequence of VGAM2705 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5416.

[90740] Another function of VGAM2705 is therefore inhibition of KIAA0318 (Accession XM_044334). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0318. KIAA1219 (Accession XM_028835) is another VGAM2705 host target gene. KIAA1219 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:30760, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90741] Another function of VGAM2705 is therefore inhibition of KIAA1219 (Accession XM_028835). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219. Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM_018557) is another VGAM2705 host target gene. LRP1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LRP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1B BINDING SITE, designated SEQ ID:20640, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90742] Another function of VGAM2705 is therefore inhibition of Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM_018557). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1B. TRIP-Br2 (Accession NM_014755) is another VGAM2705 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16487, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90743] Another function of VGAM2705 is therefore inhibition of

TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. Tubulin, Gamma Complex Associated Protein 3 (TUBGCP3, Accession NM_006322) is another VGAM2705 host target gene. TUBGCP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUBGCP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUBGCP3 BINDING SITE, designated SEQ ID:13013, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90744] Another function of VGAM2705 is therefore inhibition of Tubulin, Gamma Complex Associated Protein 3 (TUBGCP3, Accession NM_006322). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBGCP3. LOC158014 (Accession XM_088442) is another VGAM2705 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158014, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39696, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90745] Another function of VGAM2705 is therefore inhibition of LOC158014 (Accession XM_088442). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC202908 (Accession XM_114602) is another VGAM2705 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:42996, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90746] Another function of VGAM2705 is therefore inhibition of LOC202908 (Accession XM_114602). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC202908. LOC90719 (Accession XM_033704) is another VGAM2705 host target gene. LOC90719 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90719 BINDING SITE, designated SEQ ID:31948, to the nucleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, also designated SEQ ID:5416.

[90747] Another function of VGAM2705 is therefore inhibition of LOC90719 (Accession XM_033704). Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2706 (VGAM2706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90748] VGAM2706 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2706 was detected is described hereinabove with reference to Figs. 1-8.

[90749] VGAM2706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Heliothis Zea Virus 1 (HZV-1). VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90750] VGAM2706 gene encodes a VGAM2706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2706 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2706 precursor RNA is designated SEQ ID:2692, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2692 is located at position 84781 relative to the genome of Heliothis Zea Virus 1 (HZV-1).

[90751] VGAM2706 precursor RNA folds onto itself, forming VGAM2706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90752] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2706 folded precursor RNA into VGAM2706 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2706 RNA is designated SEQ ID:5417, and is provided hereinbelow with reference to the sequence listing part.

[90753] VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2706 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90754] VGAM2706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2706 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90755] The complementary binding of VGAM2706 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2706 host target RNA into VGAM2706 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90756] It is appreciated that VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2706 host target genes. The mRNA of each one of this plurality of VGAM2706 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2706 RNA, herein designated VGAM RNA, and which when bound by VGAM2706 RNA causes inhibition of translation of respective one or more VGAM2706 host target proteins.

[90757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2706 gene, herein designated VGAM GENE, on one or more VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90758] It is yet further appreciated that a function of VGAM2706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of viral infection by Heliothis Zea Virus 1 (HZV-1). Specific functions, and accordingly utilities, of VGAM2706 correlate with, and may be deduced from, the identity of the host target genes which VGAM2706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[90759] Nucleotide sequences of the VGAM2706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2706 are further described hereinbelow with reference to Table 1.

[90760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2706 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2706 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[90761] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2706 gene, herein designated VGAM is inhibition of expression of VGAM2706 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2706 correlate with, and may be deduced from, the identity of the target genes which VGAM2706 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[90762] Dachshund Homolog (Drosophila) (DACH, Accession NM_080759) is a VGAM2706 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28035, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90763] A function of VGAM2706 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM2706 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10362, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90764] Another function of VGAM2706 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM2706 host target gene. C20orf139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of C20orf139 BINDING SITE, designated SEQ ID:41107, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90765] Another function of VGAM2706 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf139. FLJ13769 (Accession NM_025012) is another VGAM2706 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24590, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90766] Another function of VGAM2706 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13769. FLJ32734 (Accession NM_144681) is another VGAM2706 host target gene. FLJ32734 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32734 BINDING SITE, designated SEQ ID:29496, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90767] Another function of VGAM2706 is therefore inhibition of FLJ32734 (Accession NM_144681). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32734. KIAA0494 (Accession NM_014774) is another VGAM2706 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16590, to the nucleotide sequence of VGAM2706 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5417.

[90768] Another function of VGAM2706 is therefore inhibition of KIAA0494 (Accession NM_014774). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. KIAA1775 (Accession NM_033100) is another VGAM2706 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26942, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90769] Another function of VGAM2706 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. MGC2749 (Accession NM_024069) is another VGAM2706 host target gene. MGC2749 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2749, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2749 BINDING SITE, designated SEQ ID:23499, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90770] Another function of VGAM2706 is therefore inhibition of MGC2749 (Accession NM_024069). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2749. MGC3178 (Accession NM_030810) is another VGAM2706 host target gene. MGC3178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3178 BINDING SITE, designated SEQ ID:25131, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90771] Another function of VGAM2706 is therefore inhibition of MGC3178 (Accession NM_030810). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC3178. LOC146229 (Accession XM_085387) is another VGAM2706 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38111, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90772] Another function of VGAM2706 is therefore inhibition of LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC147040 (Accession XM_085689) is another VGAM2706 host target gene. LOC147040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147040 BINDING SITE, designated SEQ ID:38287, to

the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90773] Another function of VGAM2706 is therefore inhibition of LOC147040 (Accession XM_085689). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147040. LOC154881 (Accession XM_088063) is another VGAM2706 host target gene. LOC154881 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39496, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90774] Another function of VGAM2706 is therefore inhibition of LOC154881 (Accession XM_088063). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154881. LOC155036 (Accession XM_098651) is another VGAM2706 host target gene. LOC155036 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC155036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155036 BINDING SITE, designated SEQ ID:41753, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90775] Another function of VGAM2706 is therefore inhibition of LOC155036 (Accession XM_098651). Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155036. LOC253681 (Accession XM_170830) is another VGAM2706 host target gene. LOC253681 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253681 BINDING SITE, designated SEQ ID:45605, to the nucleotide sequence of VGAM2706 RNA, herein designated VGAM RNA, also designated SEQ ID:5417.

[90776] Another function of VGAM2706 is therefore inhibition of LOC253681 (Accession XM_170830). Accordingly, utilities

of VGAM2706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253681. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2707 (VGAM2707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[90777] VGAM2707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2707 was detected is described hereinabove with reference to Figs. 1-8.

[90778] VGAM2707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Heliothis Zea Virus 1 (HZV-1). VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[90779] VGAM2707 gene encodes a VGAM2707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2707 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2707 precursor RNA is designated SEQ ID:2693, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2693 is located at position 85718 relative to the genome of Heliothis Zea Virus 1 (HZV-1).

[90780] VGAM2707 precursor RNA folds onto itself, forming VGAM2707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[90781] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2707 folded precursor RNA into VGAM2707 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2707 RNA is designated SEQ ID:5418, and

is provided hereinbelow with reference to the sequence listing part.

[90782] VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2707 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[90783] VGAM2707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2707 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[90784] The complementary binding of VGAM2707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2707 host target RNA into VGAM2707 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[90785] It is appreciated that VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2707 host target genes. The mRNA of each one of this plurality of VGAM2707 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2707 RNA, herein designated VGAM RNA, and which when bound by VGAM2707 RNA causes inhibition of translation of respective one or more VGAM2707 host target proteins.

[90786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2707 gene, herein designated VGAM GENE, on one or more VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[90787] It is yet further appreciated that a function of VGAM2707 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2707 include diagnosis, prevention and treatment of viral infection by Heliothis Zea Virus 1 (HZV-1). Specific functions, and accordingly utilities, of VGAM2707 correlate with, and may be deduced from, the identity of the host target genes which VGAM2707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
